functions, and accordingly utilities, of VGAM1491 correlate with, and may be deduced from, the identity of the host target genes which VGAM1491 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20840] Nucleotide sequences of the VGAM1491 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1491 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1491 are further described hereinbelow with reference to Table 1.

[20841] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1491 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20842] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1492 (VGAM1492) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[20843] VGAM1492 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1492 was detected is described hereinabove with reference to Figs. 2-8.

[20844] VGAM1492 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Johnsongrass mosaic virus. VGAM1492 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20845] VGAM1492 gene, herein designated VGAM GENE, encodes a VGAM1492 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1492 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1492 precursor RNA is designated SEQ ID:1478, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1478 is located at position 2047 relative to the genome of Johnsongrass mosaic virus.

[20846] VGAM1492 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20847] An enzyme complex designated DICER COMPLEX, dices the VGAM1492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1492 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1492 RNA is designated SEQ ID:4203, and is provided hereinbelow with reference to the sequence listing part.

[20848] VGAM1492 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1492 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1492 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20849] VGAM1492 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1492 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1492 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1492 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1492 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20850] The complementary binding of VGAM1492 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1492 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1492 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1492 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20851] It is appreciated that VGAM1492 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1492 host target genes. The mRNA of each one of this plurality of VGAM1492 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1492 RNA, herein designated VGAM RNA, and which when bound by VGAM1492 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1492 host target proteins.

[20852] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1492 gene, herein designated VGAM GENE, on one or more VGAM1492 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20853] It is yet further appreciated that a function of VGAM1492 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1492 include diagnosis, prevention and

treatment of viral infection by Johnsongrass mosaic virus. Specific functions, and accordingly utilities, of VGAM1492 correlate with, and may be deduced from, the identity of the host target genes which VGAM1492 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20854] Nucleotide sequences of the VGAM1492 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1492 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1492 are further described hereinbelow with reference to Table 1.

[20855] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1492 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20856] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1493 (VGAM1493) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20857] VGAM1493 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1493 was detected is described hereinabove with reference to Figs. 2-8.

[20858] VGAM1493 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Johnsongrass mosaic virus. VGAM1493 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20859] VGAM1493 gene, herein designated VGAM GENE, encodes a VGAM1493 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1493 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1493 precursor RNA is designated SEQ ID:1479, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1479 is located at position 7469 relative to the genome of Johnsongrass mosaic virus.

[20860] VGAM1493 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20861] An enzyme complex designated DICER COMPLEX, dices the VGAM1493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1493 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1493 RNA is designated SEQ ID:4204, and is provided hereinbelow with reference to the sequence listing part.

[20862] VGAM1493 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1493 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1493 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20863] VGAM1493 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1493 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1493 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1493 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20864] The complementary binding of VGAM1493 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1493 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1493 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1493 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20865] It is appreciated that VGAM1493 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1493 host target genes. The mRNA of each one of this plurality of VGAM1493 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1493 RNA, herein designated VGAM

RNA, and which when bound by VGAM1493 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1493 host target proteins.

[20866] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1493 gene, herein designated VGAM GENE, on one or more VGAM1493 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20867] It is yet further appreciated that a function of VGAM1493 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1493 include diagnosis, prevention and treatment of viral infection by Johnsongrass mosaic virus. Specific functions, and accordingly utilities, of VGAM1493 correlate with, and may be deduced from, the identity of the host target genes which VGAM1493 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20868] Nucleotide sequences of the VGAM1493 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1493 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1493 are further described hereinbelow with reference to Table 1.

[20869] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1493 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20870] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1494 (VGAM1494) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20871] VGAM1494 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1494 was detected is described hereinabove with reference to Figs. 2-8.

[20872] VGAM1494 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Johnsongrass mosaic virus. VGAM1494 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20873] VGAM1494 gene, herein designated VGAM GENE, encodes a VGAM1494 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1494 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1494 precursor RNA is designated SEQ ID:1480, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1480 is located at position 656

relative to the genome of Johnsongrass mosaic virus.

[20874] VGAM1494 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20875] An enzyme complex designated DICER COMPLEX, dices the VGAM1494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1494 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1494 RNA is designated SEQ ID:4205, and is provided hereinbelow with reference to the sequence listing part.

[20876] VGAM1494 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1494 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1494 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20877] VGAM1494 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1494 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1494 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1494 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1494 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20878] The complementary binding of VGAM1494 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1494 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1494 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1494 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20879] It is appreciated that VGAM1494 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1494 host target genes. The mRNA of each one of this plurality of VGAM1494 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1494 RNA, herein designated VGAM RNA, and which when bound by VGAM1494 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1494 host target proteins.

[20880] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1494 gene, herein designated VGAM GENE, on one or more VGAM1494 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20881] It is yet further appreciated that a function of VGAM1494 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1494 include diagnosis, prevention and treatment of viral infection by Johnsongrass mosaic virus. Specific functions, and accordingly utilities, of VGAM1494 correlate with, and may be deduced from, the identity of the host target genes which VGAM1494 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20882] Nucleotide sequences of the VGAM1494 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1494 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1494 are further described hereinbelow with reference to Table 1.

[20883] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1494 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20884] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1495 (VGAM1495) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20885] VGAM1495 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1495 was detected is described hereinabove with reference to Figs. 2-8.

[20886] VGAM1495 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Johnsongrass mosaic virus. VGAM1495 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20887] VGAM1495 gene, herein designated VGAM GENE, encodes a VGAM1495 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1495 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1495 precursor RNA is designated SEQ ID:1481, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1481 is located at position 5140 relative to the genome of Johnsongrass mosaic virus.

[20888] VGAM1495 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20889] An enzyme complex designated DICER COMPLEX, dices the VGAM1495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1495 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1495 RNA is designated SEQ ID:4206, and is provided hereinbelow with reference to the sequence

listing part.

[20890] VGAM1495 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1495 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1495 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20891] VGAM1495 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1495 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1495 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1495 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1495 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20892] The complementary binding of VGAM1495 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1495 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1495 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1495 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20893] It is appreciated that VGAM1495 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1495 host target genes. The mRNA of each one of this plurality of VGAM1495 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1495 RNA, herein designated VGAM RNA, and which when bound by VGAM1495 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1495 host target proteins.

[20894] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1495 gene, herein designated VGAM GENE, on one or more VGAM1495 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20895] It is yet further appreciated that a function of VGAM1495

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of viral infection by Johnsongrass mosaic virus. Specific functions, and accordingly utilities, of VGAM1495 correlate with, and may be deduced from, the identity of the host target genes which VGAM1495 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20896] Nucleotide sequences of the VGAM1495 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1495 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1495 are further described hereinbelow with reference to Table 1.

[20897] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1495 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20898] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1496 (VGAM1496) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20899] VGAM1496 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1496 was detected is described hereinabove with reference to Figs. 2-8.

[20900] VGAM1496 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM1496 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20901] VGAM1496 gene, herein designated VGAM GENE, encodes a VGAM1496 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1496 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1496 precursor RNA is designated SEQ ID:1482, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1482 is located at position 110360 relative to the genome of Alcelaphine herpesvirus 1.

[20902] VGAM1496 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20903] An enzyme complex designated DICER COMPLEX, dices the VGAM1496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1496 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide se-

quence of VGAM1496 RNA is designated SEQ ID:4207, and is provided hereinbelow with reference to the sequence listing part.

[20904] VGAM1496 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1496 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1496 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20905] VGAM1496 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1496 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1496 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1496 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1496 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20906] The complementary binding of VGAM1496 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1496 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1496 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1496 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20907] It is appreciated that VGAM1496 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1496 host target genes. The mRNA of

each one of this plurality of VGAM1496 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1496 RNA, herein designated VGAM RNA, and which when bound by VGAM1496 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1496 host target proteins.

[20908] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1496 gene, herein designated VGAM GENE, on one or more VGAM1496 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[20909] It is yet further appreciated that a function of VGAM1496 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1496 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1496 correlate with, and may be deduced from, the identity of the host target genes which VGAM1496 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20910] Nucleotide sequences of the VGAM1496 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1496 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1496 are further described hereinbelow with reference to Table 1.

[20911] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1496 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[20912] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1497 (VGAM1497) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20913] VGAM1497 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1497 was detected is described hereinabove with reference to Figs. 2-8.

[20914] VGAM1497 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM1497 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20915] VGAM1497 gene, herein designated VGAM GENE, encodes a VGAM1497 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1497 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1497 precursor RNA is designated SEQ ID:1483, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1483 is located at position 108884 relative to the genome of Alcelaphine herpesvirus 1.

[20916] VGAM1497 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20917] An enzyme complex designated DICER COMPLEX, dices the VGAM1497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1497 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1497 RNA is designated SEQ ID:4208, and is provided hereinbelow with reference to the sequence listing part.

[20918] VGAM1497 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1497 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1497 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20919] VGAM1497 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1497 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1497 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1497 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20920] The complementary binding of VGAM1497 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1497 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1497 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1497 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20921] It is appreciated that VGAM1497 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1497 host target genes. The mRNA of each one of this plurality of VGAM1497 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1497 RNA, herein designated VGAM RNA, and which when bound by VGAM1497 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1497 host target proteins.

[20922] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1497 gene, herein designated VGAM GENE, on one or more VGAM1497 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20923] It is yet further appreciated that a function of VGAM1497 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1497 correlate with, and may be deduced from, the identity of the host target genes which VGAM1497 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20924] Nucleotide sequences of the VGAM1497 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1497 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1497 are further described hereinbelow with reference to Table 1.

[20925] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1497 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20926] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1498 (VGAM1498) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20927] VGAM1498 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1498 was detected is described hereinabove with reference to Figs. 2-8.

[20928] VGAM1498 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM1498 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20929] VGAM1498 gene, herein designated VGAM GENE, encodes a VGAM1498 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1498 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1498 precursor RNA is designated SEQ ID:1484, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1484 is located at position 112274 relative to the genome of Alcelaphine herpesvirus 1.

[20930] VGAM1498 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20931] An enzyme complex designated DICER COMPLEX, dices the VGAM1498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1498 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1498 RNA is designated SEQ ID:4209, and is provided hereinbelow with reference to the sequence listing part.

[20932] VGAM1498 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1498 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1498 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20933] VGAM1498 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1498 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1498 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1498 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20934] The complementary binding of VGAM1498 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1498 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1498 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1498 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[20935] It is appreciated that VGAM1498 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1498 host target genes. The mRNA of each one of this plurality of VGAM1498 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1498 RNA, herein designated VGAM RNA, and which when bound by VGAM1498 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1498 host target proteins.

[20936] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1498 gene, herein designated VGAM GENE, on one or more VGAM1498 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20937] It is yet further appreciated that a function of VGAM1498 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1498 correlate with, and may be deduced from, the identity of the host target genes which VGAM1498 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20938] Nucleotide sequences of the VGAM1498 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1498 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1498 are further described hereinbelow with reference to Table 1.

[20939] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1498 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20940] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1499 (VGAM1499) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20941] VGAM1499 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1499 was detected is described hereinabove with reference to Figs. 2-8.

[20942] VGAM1499 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM1499 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20943] VGAM1499 gene, herein designated VGAM GENE, encodes a VGAM1499 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1499 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1499 precursor RNA is designated SEQ ID:1485, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1485 is located at position 110926 relative to the genome of Alcelaphine herpesvirus 1.

[20944] VGAM1499 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20945] An enzyme complex designated DICER COMPLEX, dices the VGAM1499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1499 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1499 RNA is designated SEQ ID:4210, and is provided hereinbelow with reference to the sequence listing part.

[20946] VGAM1499 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1499 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1499 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20947] VGAM1499 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1499 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1499 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1499 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20948] The complementary binding of VGAM1499 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1499 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1499 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1499 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20949] It is appreciated that VGAM1499 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1499 host target genes. The mRNA of each one of this plurality of VGAM1499 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1499 RNA, herein designated VGAM RNA, and which when bound by VGAM1499 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1499 host target proteins.

[20950] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1499 gene, herein designated VGAM GENE, on one or more VGAM1499 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20951] It is yet further appreciated that a function of VGAM1499 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1499 correlate with, and may be deduced from, the identity of the host target genes which VGAM1499 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20952] Nucleotide sequences of the VGAM1499 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1499 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1499 are further

described hereinbelow with reference to Table 1.

[20953] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1499 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20954] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1500 (VGAM1500) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20955] VGAM1500 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1500 was detected is described hereinabove with reference to Figs. 2-8.

[20956] VGAM1500 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid lethal paralysis virus. VGAM1500 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20957] VGAM1500 gene, herein designated VGAM GENE, encodes a VGAM1500 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1500 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1500 precursor RNA is designated SEQ ID:1486, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1486 is located at position 3755 relative to the genome of Aphid lethal paralysis virus.

[20958] VGAM1500 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20959] An enzyme complex designated DICER COMPLEX, dices the VGAM1500 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1500 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1500 RNA is designated SEQ ID:4211, and is provided hereinbelow with reference to the sequence listing part.

[20960] VGAM1500 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1500 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1500 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20961] VGAM1500 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1500 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1500 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1500 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1500 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20962] The complementary binding of VGAM1500 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1500 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1500

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1500 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20963] It is appreciated that VGAM1500 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1500 host target genes. The mRNA of each one of this plurality of VGAM1500 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1500 RNA, herein designated VGAM RNA, and which when bound by VGAM1500 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1500 host target proteins.

[20964] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1500 gene, herein designated VGAM GENE, on one or more VGAM1500 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20965] It is yet further appreciated that a function of VGAM1500 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1500 include diagnosis, prevention and treatment of viral infection by Aphid lethal paralysis virus. Specific functions, and accordingly utilities, of VGAM1500 correlate with, and may be deduced from, the identity of the host target genes which VGAM1500 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20966] Nucleotide sequences of the VGAM1500 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1500 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1500 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1500 are further described hereinbelow with reference to Table 1.

[20967] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1500 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20968] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1501 (VGAM1501) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20969] VGAM1501 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1501 was detected is described hereinabove with reference to Figs. 2-8.

[20970] VGAM1501 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid lethal paralysis virus. VGAM1501 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[20971] VGAM1501 gene, herein designated VGAM GENE, encodes a VGAM1501 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1501 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1501 precursor RNA is designated SEQ ID:1487, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1487 is located at position 1260 relative to the genome of Aphid lethal paralysis virus.

[20972] VGAM1501 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20973] An enzyme complex designated DICER COMPLEX, dices

the VGAM1501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1501 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1501 RNA is designated SEQ ID:4212, and is provided hereinbelow with reference to the sequence listing part.

[20974] VGAM1501 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1501 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1501 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20975] VGAM1501 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1501 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1501 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1501 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1501 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20976] The complementary binding of VGAM1501 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1501 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1501 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1501 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20977] It is appreciated that VGAM1501 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1501 host target genes. The mRNA of each one of this plurality of VGAM1501 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1501 RNA, herein designated VGAM RNA, and which when bound by VGAM1501 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1501 host target proteins.

[20978] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1501 gene, herein designated VGAM GENE, on one or more VGAM1501 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20979] It is yet further appreciated that a function of VGAM1501 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1501 include diagnosis, prevention and treatment of viral infection by Aphid lethal paralysis virus. Specific functions, and accordingly utilities, of VGAM1501 correlate with, and may be deduced from, the identity of the host target genes which VGAM1501 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20980] Nucleotide sequences of the VGAM1501 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1501 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1501 are further described hereinbelow with reference to Table 1.

[20981] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1501 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20982] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1502 (VGAM1502) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20983] VGAM1502 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1502 was detected is described hereinabove with reference to Figs. 2-8.

[20984] VGAM1502 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid lethal paralysis virus. VGAM1502 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20985] VGAM1502 gene, herein designated VGAM GENE, encodes a VGAM1502 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1502 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1502 precursor RNA is designated SEQ ID:1488, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1488 is located at position 1441 relative to the genome of Aphid lethal paralysis virus.

[20986] VGAM1502 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20987] An enzyme complex designated DICER COMPLEX, dices the VGAM1502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1502 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1502 RNA is designated SEQ ID:4213, and is provided hereinbelow with reference to the sequence listing part.

[20988] VGAM1502 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1502 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1502 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20989] VGAM1502 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1502 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1502 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1502 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20990] The complementary binding of VGAM1502 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1502 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1502 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1502 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20991] It is appreciated that VGAM1502 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1502 host target genes. The mRNA of each one of this plurality of VGAM1502 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1502 RNA, herein designated VGAM RNA, and which when bound by VGAM1502 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1502 host target proteins.

[20992] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1502 gene, herein designated VGAM GENE, on one or more VGAM1502 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20993] It is yet further appreciated that a function of VGAM1502 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of viral infection by Aphid lethal paralysis virus. Specific functions, and accordingly utilities, of VGAM1502 correlate with, and may be deduced from, the identity of the host target genes which VGAM1502 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20994] Nucleotide sequences of the VGAM1502 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1502 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1502 are further described hereinbelow with reference to Table 1.

[20995] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1502 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20996] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1503 (VGAM1503) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20997] VGAM1503 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1503 was detected is described hereinabove with reference to Figs. 2-8.

[20998] VGAM1503 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid lethal paralysis

virus. VGAM1503 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20999] VGAM1503 gene, herein designated VGAM GENE, encodes a VGAM1503 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1503 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1503 precursor RNA is designated SEQ ID:1489, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1489 is located at position 9098 relative to the genome of Aphid lethal paralysis virus.

[21000] VGAM1503 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[21001] An enzyme complex designated DICER COMPLEX, dices the VGAM1503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1503 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1503 RNA is designated SEQ ID:4214, and is provided hereinbelow with reference to the sequence listing part.

[21002] VGAM1503 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1503 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1503 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21003] VGAM1503 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1503 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1503 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1503 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1503 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21004] The complementary binding of VGAM1503 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1503 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1503 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1503 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21005] It is appreciated that VGAM1503 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1503 host target genes. The mRNA of each one of this plurality of VGAM1503 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1503 RNA, herein designated VGAM RNA, and which when bound by VGAM1503 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1503 host target proteins.

[21006] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1503 gene, herein designated VGAM GENE, on one or more VGAM1503 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21007] It is yet further appreciated that a function of VGAM1503 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1503 include diagnosis, prevention and treatment of viral infection by Aphid lethal paralysis virus. Specific functions, and accordingly utilities, of VGAM1503 correlate with, and may be deduced from, the identity of the host target genes which VGAM1503 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21008] Nucleotide sequences of the VGAM1503 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1503 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1503 are further described hereinbelow with reference to Table 1.

[21009] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1503 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21010] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1504 (VGAM1504) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21011] VGAM1504 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1504 was detected is described hereinabove with reference to Figs. 2-8.

[21012] VGAM1504 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Aphid lethal paralysis virus. VGAM1504 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21013] VGAM1504 gene, herein designated VGAM GENE, encodes a VGAM1504 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1504 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1504 precursor RNA is designated SEQ ID:1490, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1490 is located at position 8300 relative to the genome of Aphid lethal paralysis virus.

[21014] VGAM1504 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21015] An enzyme complex designated DICER COMPLEX, dices the VGAM1504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1504 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1504 RNA is designated SEQ ID:4215, and is provided hereinbelow with reference to the sequence listing part.

[21016] VGAM1504 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1504 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1504 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21017] VGAM1504 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1504 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1504 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1504 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1504 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21018] The complementary binding of VGAM1504 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1504 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1504 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1504 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21019] It is appreciated that VGAM1504 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1504 host target genes. The mRNA of each one of this plurality of VGAM1504 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1504 RNA, herein designated VGAM RNA, and which when bound by VGAM1504 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1504 host target proteins.

[21020] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1504 gene, herein designated VGAM GENE, on one or more VGAM1504 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21021] It is yet further appreciated that a function of VGAM1504 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1504 include diagnosis, prevention and treatment of viral infection by Aphid lethal paralysis virus. Specific functions, and accordingly utilities, of VGAM1504 correlate with, and may be deduced from, the identity of the host target genes which VGAM1504 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21022] Nucleotide sequences of the VGAM1504 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1504 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1504 are further described hereinbelow with reference to Table 1.

[21023] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1504 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21024] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1505 (VGAM1505) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21025] VGAM1505 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1505 was detected is described hereinabove with reference to Figs. 2-8.

[21026] VGAM1505 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid lethal paralysis virus. VGAM1505 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21027] VGAM1505 gene, herein designated VGAM GENE, encodes a VGAM1505 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1505 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1505 precursor RNA is designated SEQ ID:1491, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1491 is located at position 8120 relative to the genome of Aphid lethal paralysis virus.

[21028] VGAM1505 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21029] An enzyme complex designated DICER COMPLEX, dices the VGAM1505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1505 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1505 RNA is designated SEQ ID:4216, and is provided hereinbelow with reference to the sequence listing part.

[21030] VGAM1505 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1505 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1505 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[21031] VGAM1505 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1505 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1505 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1505 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21032] The complementary binding of VGAM1505 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1505 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1505 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1505 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21033] It is appreciated that VGAM1505 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1505 host target genes. The mRNA of each one of this plurality of VGAM1505 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1505 RNA, herein designated VGAM RNA, and which when bound by VGAM1505 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1505 host target proteins.

[21034] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1505 gene, herein designated VGAM GENE, on one

or more VGAM1505 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21035] It is yet further appreciated that a function of VGAM1505 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of viral infection by Aphid lethal paralysis virus. Specific functions, and accordingly utilities, of VGAM1505 correlate with, and may be deduced from, the identity of the host target genes which VGAM1505 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21036] Nucleotide sequences of the VGAM1505 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1505 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1505 are further described hereinbelow with reference to Table 1.

[21037] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1505 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21038] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1506 (VGAM1506) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21039] VGAM1506 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1506 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[21040] VGAM1506 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid lethal paralysis virus. VGAM1506 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21041] VGAM1506 gene, herein designated VGAM GENE, encodes a VGAM1506 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1506 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1506 precursor RNA is designated SEQ ID:1492, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1492 is located at position 8885 relative to the genome of Aphid lethal paralysis virus.

[21042] VGAM1506 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21043] An enzyme complex designated DICER COMPLEX, dices the VGAM1506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1506 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1506 RNA is designated SEQ ID:4217, and is provided hereinbelow with reference to the sequence listing part.

[21044] VGAM1506 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1506 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1506 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21045] VGAM1506 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1506 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1506 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1506 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1506 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[21046] The complementary binding of VGAM1506 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1506 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1506 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1506 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21047] It is appreciated that VGAM1506 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1506 host target genes. The mRNA of each one of this plurality of VGAM1506 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1506 RNA, herein designated VGAM RNA, and which when bound by VGAM1506 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1506 host target proteins.

[21048] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1506 gene, herein designated VGAM GENE, on one or more VGAM1506 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21049] It is yet further appreciated that a function of VGAM1506 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1506 include diagnosis, prevention and treatment of viral infection by Aphid lethal paralysis virus. Specific functions, and accordingly utilities, of VGAM1506 correlate with, and may be deduced from, the identity of the host target genes which VGAM1506 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[21050] Nucleotide sequences of the VGAM1506 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1506 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1506 are further described hereinbelow with reference to Table 1.

[21051] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1506 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21052] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1507 (VGAM1507) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21053] VGAM1507 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1507 was detected is described hereinabove with reference to Figs. 2-8.

[21054] VGAM1507 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid lethal paralysis virus. VGAM1507 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21055] VGAM1507 gene, herein designated VGAM GENE, encodes a VGAM1507 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1507 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1507 precursor RNA is designated SEQ ID:1493, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1493 is located at position 4389 relative to the genome of Aphid lethal paralysis virus.

[21056] VGAM1507 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21057] An enzyme complex designated DICER COMPLEX, dices the VGAM1507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1507 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1507 RNA is designated SEQ ID:4218, and is provided hereinbelow with reference to the sequence listing part.

[21058] VGAM1507 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1507 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1507 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21059] VGAM1507 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1507 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1507 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1507 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1507 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21060] The complementary binding of VGAM1507 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1507 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1507 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1507 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21061] It is appreciated that VGAM1507 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1507 host target genes. The mRNA of each one of this plurality of VGAM1507 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1507 RNA, herein designated VGAM RNA, and which when bound by VGAM1507 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1507 host target proteins.

[21062] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1507 gene, herein designated VGAM GENE, on one or more VGAM1507 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21063] It is yet further appreciated that a function of VGAM1507 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1507 include diagnosis, prevention and treatment of viral infection by Aphid lethal paralysis virus. Specific functions, and accordingly utilities, of VGAM1507 correlate with, and may be deduced from, the identity of the host target genes which VGAM1507 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[21064] Nucleotide sequences of the VGAM1507 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1507 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1507 are further described hereinbelow with reference to Table 1.

[21065] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1507 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21066] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1508 (VGAM1508) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21067] VGAM1508 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1508 was detected is described hereinabove with reference to Figs. 2-8.

[21068] VGAM1508 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus V. VGAM1508 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21069] VGAM1508 gene, herein designated VGAM GENE, encodes a VGAM1508 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1508 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1508 precursor RNA is designated SEQ ID:1494, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1494 is located at position 7772 relative to the genome of Potato virus V.

[21070] VGAM1508 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21071] An enzyme complex designated DICER COMPLEX, dices the VGAM1508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1508 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1508 RNA is designated SEQ ID:4219, and is provided hereinbelow with reference to the sequence listing part.

[21072] VGAM1508 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1508 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1508 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21073] VGAM1508 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1508 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1508 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1508 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21074] The complementary binding of VGAM1508 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1508 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1508 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1508 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21075] It is appreciated that VGAM1508 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1508 host target genes. The mRNA of each one of this plurality of VGAM1508 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1508 RNA, herein designated VGAM RNA, and which when bound by VGAM1508 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1508 host target proteins.

[21076] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1508 gene, herein designated VGAM GENE, on one or more VGAM1508 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21077] It is yet further appreciated that a function of VGAM1508 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of viral infection by Potato virus V. Specific functions, and accordingly utilities, of VGAM1508 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1508 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21078] Nucleotide sequences of the VGAM1508 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1508 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1508 are further described hereinbelow with reference to Table 1.

[21079] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1508 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21080] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1509 (VGAM1509) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21081] VGAM1509 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1509 was detected is described hereinabove with reference to Figs. 2-8.

[21082] VGAM1509 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus V. VGAM1509 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21083] VGAM1509 gene, herein designated VGAM GENE, encodes a VGAM1509 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1509 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1509 precursor RNA is designated SEQ ID:1495, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1495 is located at position 8444 relative to the genome of Potato virus V.

[21084] VGAM1509 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1509 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21085] An enzyme complex designated DICER COMPLEX, dices the VGAM1509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1509 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1509 RNA is designated SEQ ID:4220, and is provided hereinbelow with reference to the sequence listing part.

[21086] VGAM1509 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1509 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1509 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21087] VGAM1509 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1509 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1509 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1509 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1509 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21088] The complementary binding of VGAM1509 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1509 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1509 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1509 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21089] It is appreciated that VGAM1509 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1509 host target genes. The mRNA of each one of this plurality of VGAM1509 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1509 RNA, herein designated VGAM RNA, and which when bound by VGAM1509 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1509 host target proteins.

[21090] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1509 gene, herein designated VGAM GENE, on one or more VGAM1509 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21091] It is yet further appreciated that a function of VGAM1509 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1509 include diagnosis, prevention and treatment of viral infection by Potato virus V. Specific functions, and accordingly utilities, of VGAM1509 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1509 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21092] Nucleotide sequences of the VGAM1509 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1509 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1509 are further described hereinbelow with reference to Table 1.

[21093] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1509 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21094] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1510 (VGAM1510) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[21095] VGAM1510 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1510 was detected is described hereinabove with reference to Figs. 2-8.

[21096] VGAM1510 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus V. VGAM1510 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21097] VGAM1510 gene, herein designated VGAM GENE, encodes a VGAM1510 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1510 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1510 precursor RNA is designated SEQ ID:1496, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1496 is located at position 6444 relative to the genome of Potato virus V.

[21098] VGAM1510 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1510 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21099] An enzyme complex designated DICER COMPLEX, dices the VGAM1510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1510 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1510 RNA is designated SEQ ID:4221, and is provided hereinbelow with reference to the sequence listing part.

[21100] VGAM1510 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1510 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1510 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21101] VGAM1510 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1510 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1510 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1510 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1510 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21102] The complementary binding of VGAM1510 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1510 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1510 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1510 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21103] It is appreciated that VGAM1510 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1510 host target genes. The mRNA of each one of this plurality of VGAM1510 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1510 RNA, herein designated VGAM RNA, and which when bound by VGAM1510 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1510 host target proteins.

[21104] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1510 gene, herein designated VGAM GENE, on one or more VGAM1510 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21105] It is yet further appreciated that a function of VGAM1510 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1510 include diagnosis, prevention and treatment of viral infection by Potato virus V. Specific

functions, and accordingly utilities, of VGAM1510 correlate with, and may be deduced from, the identity of the host target genes which VGAM1510 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21106] Nucleotide sequences of the VGAM1510 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1510 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1510 are further described hereinbelow with reference to Table 1.

[21107] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1510 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21108] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1511 (VGAM1511) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[21109] VGAM1511 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1511 was detected is described hereinabove with reference to Figs. 2-8.

[21110] VGAM1511 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus V. VGAM1511 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21111] VGAM1511 gene, herein designated VGAM GENE, encodes a VGAM1511 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1511 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1511 precursor RNA is designated SEQ ID:1497, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1497 is located at position 4177 relative to the genome of Potato virus V.

[21112] VGAM1511 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21113] An enzyme complex designated DICER COMPLEX, dices the VGAM1511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1511 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1511 RNA is designated SEQ ID:4222, and is provided hereinbelow with reference to the sequence listing part.

[21114] VGAM1511 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1511 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1511 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21115] VGAM1511 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1511 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1511 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1511 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1511 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21116] The complementary binding of VGAM1511 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1511 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1511 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1511 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21117] It is appreciated that VGAM1511 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1511 host target genes. The mRNA of each one of this plurality of VGAM1511 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1511 RNA, herein designated VGAM RNA, and which when bound by VGAM1511 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1511 host target proteins.

[21118] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1511 gene, herein designated VGAM GENE, on one or more VGAM1511 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21119] It is yet further appreciated that a function of VGAM1511 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1511 include diagnosis, prevention and

treatment of viral infection by Potato virus V. Specific functions, and accordingly utilities, of VGAM1511 correlate with, and may be deduced from, the identity of the host target genes which VGAM1511 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21120] Nucleotide sequences of the VGAM1511 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1511 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1511 are further described hereinbelow with reference to Table 1.

[21121] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1511 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21122] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1512 (VGAM1512) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21123] VGAM1512 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1512 was detected is described hereinabove with reference to Figs. 2-8.

[21124] VGAM1512 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM1512 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21125] VGAM1512 gene, herein designated VGAM GENE, encodes a VGAM1512 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1512 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1512 precursor RNA is designated SEQ ID:1498, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1498 is located at position 7608 relative to the genome of Parsnip yellow fleck virus.

[21126] VGAM1512 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21127] An enzyme complex designated DICER COMPLEX, dices the VGAM1512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1512 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1512 RNA is designated SEQ ID:4223, and is provided hereinbelow with reference to the sequence listing part.

[21128] VGAM1512 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1512 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1512 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21129] VGAM1512 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1512 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1512 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1512 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21130] The complementary binding of VGAM1512 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1512 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1512 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1512 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21131] It is appreciated that VGAM1512 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1512 host target genes. The mRNA of each one of this plurality of VGAM1512 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1512 RNA, herein designated VGAM

RNA, and which when bound by VGAM1512 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1512 host target proteins.

[21132] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1512 gene, herein designated VGAM GENE, on one or more VGAM1512 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21133] It is yet further appreciated that a function of VGAM1512 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1512 include diagnosis, prevention and treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM1512 correlate with, and may be deduced from, the identity of the host target genes which VGAM1512 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21134] Nucleotide sequences of the VGAM1512 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1512 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1512 are further described hereinbelow with reference to Table 1.

[21135] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1512 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21136] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1513 (VGAM1513) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21137] VGAM1513 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1513 was detected is described hereinabove with reference to Figs. 2-8.

[21138] VGAM1513 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM1513 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21139] VGAM1513 gene, herein designated VGAM GENE, encodes a VGAM1513 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1513 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1513 precursor RNA is designated SEQ ID:1499, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1499 is located at position 3

relative to the genome of Parsnip yellow fleck virus.

[21140] VGAM1513 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21141] An enzyme complex designated DICER COMPLEX, dices the VGAM1513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1513 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1513 RNA is designated SEQ ID:4224, and is provided hereinbelow with reference to the sequence listing part.

[21142] VGAM1513 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1513 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1513 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21143] VGAM1513 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1513 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1513 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1513 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1513 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21144] The complementary binding of VGAM1513 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1513 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1513 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1513 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21145] It is appreciated that VGAM1513 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1513 host target genes. The mRNA of each one of this plurality of VGAM1513 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1513 RNA, herein designated VGAM RNA, and which when bound by VGAM1513 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1513 host target proteins.

[21146] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1513 gene, herein designated VGAM GENE, on one or more VGAM1513 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21147] It is yet further appreciated that a function of VGAM1513 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1513 include diagnosis, prevention and treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM1513 correlate with, and may be deduced from, the identity of the host target genes which VGAM1513 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21148] Nucleotide sequences of the VGAM1513 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1513 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1513 are further described hereinbelow with reference to Table 1.

[21149] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1513 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21150] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1514 (VGAM1514) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21151] VGAM1514 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1514 was detected is described hereinabove with reference to Figs. 2-8.

[21152] VGAM1514 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM1514 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21153] VGAM1514 gene, herein designated VGAM GENE, encodes a VGAM1514 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1514 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1514 precursor RNA is designated SEQ ID:1500, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1500 is located at position 9392 relative to the genome of Parsnip yellow fleck virus.

[21154] VGAM1514 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21155] An enzyme complex designated DICER COMPLEX, dices the VGAM1514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1514 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1514 RNA is designated SEQ ID:4225, and is provided hereinbelow with reference to the sequence

listing part.

[21156] VGAM1514 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1514 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1514 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21157] VGAM1514 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1514 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1514 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1514 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21158] The complementary binding of VGAM1514 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1514 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1514 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1514 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21159] It is appreciated that VGAM1514 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1514 host target genes. The mRNA of each one of this plurality of VGAM1514 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1514 RNA, herein designated VGAM RNA, and which when bound by VGAM1514 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1514 host target proteins.

[21160] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1514 gene, herein designated VGAM GENE, on one or more VGAM1514 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21161] It is yet further appreciated that a function of VGAM1514

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM1514 correlate with, and may be deduced from, the identity of the host target genes which VGAM1514 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21162] Nucleotide sequences of the VGAM1514 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1514 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1514 are further described hereinbelow with reference to Table 1.

[21163] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1514 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21164] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1515 (VGAM1515) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21165] VGAM1515 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1515 was detected is described hereinabove with reference to Figs. 2-8.

[21166] VGAM1515 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM1515 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21167] VGAM1515 gene, herein designated VGAM GENE, encodes a VGAM1515 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1515 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1515 precursor RNA is designated SEQ ID:1501, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1501 is located at position 2895 relative to the genome of Parsnip yellow fleck virus.

[21168] VGAM1515 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21169] An enzyme complex designated DICER COMPLEX, dices the VGAM1515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1515 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1515 RNA is designated SEQ ID:4226, and

is provided hereinbelow with reference to the sequence listing part.

[21170] VGAM1515 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1515 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1515 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21171] VGAM1515 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1515 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1515 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1515 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1515 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21172] The complementary binding of VGAM1515 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1515 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1515 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1515 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21173] It is appreciated that VGAM1515 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1515 host target genes. The mRNA of each one of this plurality of VGAM1515 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1515 RNA, herein designated VGAM RNA, and which when bound by VGAM1515 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1515 host target proteins.

[21174] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1515 gene, herein designated VGAM GENE, on one or more VGAM1515 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21175] It is yet further appreciated that a function of VGAM1515 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1515 include diagnosis, prevention and treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM1515 correlate with, and may be deduced from, the identity of the host target genes which VGAM1515 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21176] Nucleotide sequences of the VGAM1515 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1515 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1515 are further described hereinbelow with reference to Table 1.

[21177] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1515 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21178] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1516 (VGAM1516) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21179] VGAM1516 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1516 was detected is described hereinabove with reference to Figs. 2-8.

[21180] VGAM1516 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM1516 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21181] VGAM1516 gene, herein designated VGAM GENE, encodes a VGAM1516 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1516 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1516 precur-

sor RNA is designated SEQ ID:1502, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1502 is located at position 1828 relative to the genome of Parsnip yellow fleck virus.

[21182] VGAM1516 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21183] An enzyme complex designated DICER COMPLEX, dices the VGAM1516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1516 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide se-

quence of VGAM1516 RNA is designated SEQ ID:4227, and is provided hereinbelow with reference to the sequence listing part.

[21184] VGAM1516 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1516 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1516 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21185] VGAM1516 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1516 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1516 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1516 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1516 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21186] The complementary binding of VGAM1516 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1516 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1516 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1516 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21187] It is appreciated that VGAM1516 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1516 host target genes. The mRNA of

each one of this plurality of VGAM1516 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1516 RNA, herein designated VGAM RNA, and which when bound by VGAM1516 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1516 host target proteins.

[21188] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1516 gene, herein designated VGAM GENE, on one or more VGAM1516 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[21189] It is yet further appreciated that a function of VGAM1516 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1516 include diagnosis, prevention and treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM1516 correlate with, and may be deduced from, the identity of the host target genes which VGAM1516 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21190] Nucleotide sequences of the VGAM1516 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1516 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1516 are further described hereinbelow with reference to Table 1.

[21191] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1516 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[21192] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1517 (VGAM1517) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21193] VGAM1517 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1517 was detected is described hereinabove with reference to Figs. 2-8.

[21194] VGAM1517 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pea seed-borne mosaic virus. VGAM1517 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21195] VGAM1517 gene, herein designated VGAM GENE, encodes a VGAM1517 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1517 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1517 precursor RNA is designated SEQ ID:1503, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1503 is located at position 6741 relative to the genome of Pea seed-borne mosaic virus.

[21196] VGAM1517 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21197] An enzyme complex designated DICER COMPLEX, dices the VGAM1517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1517 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1517 RNA is designated SEQ ID:4228, and is provided hereinbelow with reference to the sequence listing part.

[21198] VGAM1517 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1517 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1517 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21199] VGAM1517 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1517 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1517 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1517 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1517 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21200] The complementary binding of VGAM1517 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1517 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1517 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1517 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21201] It is appreciated that VGAM1517 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1517 host target genes. The mRNA of each one of this plurality of VGAM1517 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1517 RNA, herein designated VGAM RNA, and which when bound by VGAM1517 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1517 host target proteins.

[21202] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1517 gene, herein designated VGAM GENE, on one or more VGAM1517 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21203] It is yet further appreciated that a function of VGAM1517 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1517 include diagnosis, prevention and treatment of viral infection by Pea seed-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM1517 correlate with, and may be deduced from, the identity of the host target genes which VGAM1517 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21204] Nucleotide sequences of the VGAM1517 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1517 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1517 are further described hereinbelow with reference to Table 1.

[21205] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1517 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21206] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1518 (VGAM1518) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21207] VGAM1518 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1518 was detected is described hereinabove with reference to Figs. 2-8.

[21208] VGAM1518 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pea seed-borne mosaic virus. VGAM1518 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21209] VGAM1518 gene, herein designated VGAM GENE, encodes a VGAM1518 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1518 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1518 precursor RNA is designated SEQ ID:1504, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1504 is located at position 9398 relative to the genome of Pea seed-borne mosaic virus.

[21210] VGAM1518 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21211] An enzyme complex designated DICER COMPLEX, dices the VGAM1518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1518 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1518 RNA is designated SEQ ID:4229, and is provided hereinbelow with reference to the sequence listing part.

[21212] VGAM1518 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1518 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1518 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21213] VGAM1518 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1518 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1518 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1518 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1518 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21214] The complementary binding of VGAM1518 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1518 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1518 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1518 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21215] It is appreciated that VGAM1518 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1518 host target genes. The mRNA of each one of this plurality of VGAM1518 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1518 RNA, herein designated VGAM RNA, and which when bound by VGAM1518 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1518 host target proteins.

[21216] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1518 gene, herein designated VGAM GENE, on one or more VGAM1518 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21217] It is yet further appreciated that a function of VGAM1518 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1518 include diagnosis, prevention and treatment of viral infection by Pea seed-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM1518 correlate with, and may be deduced from, the identity of the host target genes which VGAM1518 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21218] Nucleotide sequences of the VGAM1518 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1518 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1518 are further described hereinbelow with reference to Table 1.

[21219] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1518 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21220] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1519 (VGAM1519) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21221] VGAM1519 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1519 was detected is described hereinabove with reference to Figs. 2-8.

[21222] VGAM1519 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pea seed-borne mosaic virus. VGAM1519 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21223] VGAM1519 gene, herein designated VGAM GENE, encodes a VGAM1519 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1519 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1519 precursor RNA is designated SEQ ID:1505, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1505 is located at position 3823 relative to the genome of Pea seed-borne mosaic virus.

[21224] VGAM1519 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21225] An enzyme complex designated DICER COMPLEX, dices the VGAM1519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1519 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1519 RNA is designated SEQ ID:4230, and is provided hereinbelow with reference to the sequence listing part.

[21226] VGAM1519 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1519 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1519 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21227] VGAM1519 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1519 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1519 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1519 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21228] The complementary binding of VGAM1519 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1519 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1519 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1519 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21229] It is appreciated that VGAM1519 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1519 host target genes. The mRNA of each one of this plurality of VGAM1519 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1519 RNA, herein designated VGAM RNA, and which when bound by VGAM1519 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1519 host target proteins.

[21230] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1519 gene, herein designated VGAM GENE, on one or more VGAM1519 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21231] It is yet further appreciated that a function of VGAM1519 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of viral infection by Pea seed-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM1519 correlate with, and may be deduced from, the identity of the host target genes which VGAM1519 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21232] Nucleotide sequences of the VGAM1519 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1519 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1519 are further described hereinbelow with reference to Table 1.

[21233] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1519 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21234] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1520 (VGAM1520) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21235] VGAM1520 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1520 was detected is described hereinabove with reference to Figs. 2-8.

[21236] VGAM1520 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM1520 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21237] VGAM1520 gene, herein designated VGAM GENE, encodes a VGAM1520 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1520 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1520 precursor RNA is designated SEQ ID:1506, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1506 is located at position 74844 relative to the genome of Ectromelia virus.

[21238] VGAM1520 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21239] An enzyme complex designated DICER COMPLEX, dices the VGAM1520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1520 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1520 RNA is designated SEQ ID:4231, and is provided hereinbelow with reference to the sequence listing part.

[21240] VGAM1520 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1520 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1520 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21241] VGAM1520 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1520 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1520 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1520 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1520 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21242] The complementary binding of VGAM1520 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1520 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1520 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1520 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[21243] It is appreciated that VGAM1520 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1520 host target genes. The mRNA of each one of this plurality of VGAM1520 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1520 RNA, herein designated VGAM RNA, and which when bound by VGAM1520 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1520 host target proteins.

[21244] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1520 gene, herein designated VGAM GENE, on one or more VGAM1520 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21245] It is yet further appreciated that a function of VGAM1520 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1520 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM1520 correlate with, and may be deduced from, the identity of the host target genes which VGAM1520 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21246] Nucleotide sequences of the VGAM1520 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1520 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1520 are further described hereinbelow with reference to Table 1.

[21247] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1520 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21248] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1521 (VGAM1521) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21249] VGAM1521 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1521 was detected is described hereinabove with reference to Figs. 2-8.

[21250] VGAM1521 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM1521 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21251] VGAM1521 gene, herein designated VGAM GENE, encodes a VGAM1521 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1521 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1521 precursor RNA is designated SEQ ID:1507, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1507 is located at position 67798 relative to the genome of Ectromelia virus.

[21252] VGAM1521 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21253] An enzyme complex designated DICER COMPLEX, dices the VGAM1521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1521 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1521 RNA is designated SEQ ID:4232, and is provided hereinbelow with reference to the sequence listing part.

[21254] VGAM1521 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1521 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1521 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21255] VGAM1521 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1521 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1521 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1521 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1521 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21256] The complementary binding of VGAM1521 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1521 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1521 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1521 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21257] It is appreciated that VGAM1521 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1521 host target genes. The mRNA of each one of this plurality of VGAM1521 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1521 RNA, herein designated VGAM RNA, and which when bound by VGAM1521 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1521 host target proteins.

[21258] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1521 gene, herein designated VGAM GENE, on one or more VGAM1521 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21259] It is yet further appreciated that a function of VGAM1521 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1521 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM1521 correlate with, and may be deduced from, the identity of the host target genes which VGAM1521 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21260] Nucleotide sequences of the VGAM1521 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1521 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1521 are further described hereinbelow with reference to Table 1.

[21261] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1521 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21262] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1522 (VGAM1522) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21263] VGAM1522 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1522 was detected is described hereinabove with reference to Figs. 2-8.

[21264] VGAM1522 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM1522 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21265] VGAM1522 gene, herein designated VGAM GENE, encodes

a VGAM1522 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1522 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1522 precursor RNA is designated SEQ ID:1508, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1508 is located at position 72179 relative to the genome of Ectromelia virus.

[21266] VGAM1522 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21267] An enzyme complex designated DICER COMPLEX, dices the VGAM1522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1522 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1522 RNA is designated SEQ ID:4233, and is provided hereinbelow with reference to the sequence listing part.

[21268] VGAM1522 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1522 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1522 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21269] VGAM1522 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1522 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1522 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1522 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1522 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21270] The complementary binding of VGAM1522 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1522 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1522 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1522 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21271] It is appreciated that VGAM1522 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1522 host target genes. The mRNA of each one of this plurality of VGAM1522 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1522 RNA, herein designated VGAM RNA, and which when bound by VGAM1522 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1522 host target proteins.

[21272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1522 gene, herein designated VGAM GENE, on one or more VGAM1522 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21273] It is yet further appreciated that a function of VGAM1522 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1522 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM1522 correlate with, and may be deduced from, the identity of the host target genes which VGAM1522 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21274] Nucleotide sequences of the VGAM1522 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1522 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1522 are further

described hereinbelow with reference to Table 1.

[21275] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1522 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21276] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1523 (VGAM1523) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21277] VGAM1523 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1523 was detected is described hereinabove with reference to Figs. 2-8.

[21278] VGAM1523 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM1523 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21279] VGAM1523 gene, herein designated VGAM GENE, encodes a VGAM1523 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1523 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1523 precursor RNA is designated SEQ ID:1509, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1509 is located at position 79940 relative to the genome of Cowpox virus.

[21280] VGAM1523 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21281] An enzyme complex designated DICER COMPLEX, dices the VGAM1523 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1523 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1523 RNA is designated SEQ ID:4234, and is provided hereinbelow with reference to the sequence listing part.

[21282] VGAM1523 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1523 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1523 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21283] VGAM1523 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1523 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1523 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1523 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21284] The complementary binding of VGAM1523 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1523 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1523

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1523 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21285] It is appreciated that VGAM1523 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1523 host target genes. The mRNA of each one of this plurality of VGAM1523 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1523 RNA, herein designated VGAM RNA, and which when bound by VGAM1523 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1523 host target proteins.

[21286] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1523 gene, herein designated VGAM GENE, on one or more VGAM1523 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21287] It is yet further appreciated that a function of VGAM1523 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1523 correlate with, and may be deduced from, the identity of the host target genes which VGAM1523 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21288] Nucleotide sequences of the VGAM1523 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1523 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1523 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1523 are further described hereinbelow with reference to Table 1.

[21289] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1523 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21290] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1524 (VGAM1524) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21291] VGAM1524 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1524 was detected is described hereinabove with reference to Figs. 2-8.

[21292] VGAM1524 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM1524 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[21293] VGAM1524 gene, herein designated VGAM GENE, encodes a VGAM1524 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1524 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1524 precursor RNA is designated SEQ ID:1510, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1510 is located at position 76982 relative to the genome of Cowpox virus.

[21294] VGAM1524 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21295] An enzyme complex designated DICER COMPLEX, dices

the VGAM1524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1524 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1524 RNA is designated SEQ ID:4235, and is provided hereinbelow with reference to the sequence listing part.

[21296] VGAM1524 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1524 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1524 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21297] VGAM1524 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1524 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1524 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1524 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1524 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21298] The complementary binding of VGAM1524 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1524 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1524 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1524 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21299] It is appreciated that VGAM1524 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1524 host target genes. The mRNA of each one of this plurality of VGAM1524 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1524 RNA, herein designated VGAM RNA, and which when bound by VGAM1524 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1524 host target proteins.

[21300] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1524 gene, herein designated VGAM GENE, on one or more VGAM1524 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21301] It is yet further appreciated that a function of VGAM1524 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1524 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1524 correlate with, and may be deduced from, the identity of the host target genes which VGAM1524 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21302] Nucleotide sequences of the VGAM1524 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1524 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1524 are further described hereinbelow with reference to Table 1.

[21303] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1524 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21304] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1525 (VGAM1525) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21305] VGAM1525 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1525 was detected is described hereinabove with reference to Figs. 2-8.

[21306] VGAM1525 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1525 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[21307] VGAM1525 gene, herein designated VGAM GENE, encodes a VGAM1525 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1525 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1525 precursor RNA is designated SEQ ID:1511, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1511 is located at position 62387 relative to the genome of Camelpox virus.

[21308] VGAM1525 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21309] An enzyme complex designated DICER COMPLEX, dices the VGAM1525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1525 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1525 RNA is designated SEQ ID:4236, and is provided hereinbelow with reference to the sequence listing part.

[21310] VGAM1525 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1525 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1525 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21311] VGAM1525 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1525 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1525 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1525 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1525 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21312] The complementary binding of VGAM1525 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1525 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1525 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1525 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21313] It is appreciated that VGAM1525 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1525 host target genes. The mRNA of each one of this plurality of VGAM1525 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1525 RNA, herein designated VGAM RNA, and which when bound by VGAM1525 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1525 host target proteins.

[21314] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1525 gene, herein designated VGAM GENE, on one or more VGAM1525 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21315] It is yet further appreciated that a function of VGAM1525 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1525 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1525 correlate with, and may be deduced from, the identity of the host target genes which VGAM1525 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21316] Nucleotide sequences of the VGAM1525 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1525 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1525 are further described hereinbelow with reference to Table 1.

[21317] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1525 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21318] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1526 (VGAM1526) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21319] VGAM1526 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1526 was detected is described hereinabove with reference to Figs. 2-8.

[21320] VGAM1526 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus.

VGAM1526 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21321] VGAM1526 gene, herein designated VGAM GENE, encodes a VGAM1526 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1526 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1526 precursor RNA is designated SEQ ID:1512, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1512 is located at position 71872 relative to the genome of Ectromelia virus.

[21322] VGAM1526 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[21323] An enzyme complex designated DICER COMPLEX, dices the VGAM1526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1526 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1526 RNA is designated SEQ ID:4237, and is provided hereinbelow with reference to the sequence listing part.

[21324] VGAM1526 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1526 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1526 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21325] VGAM1526 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1526 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1526 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1526 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1526 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21326] The complementary binding of VGAM1526 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1526 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1526 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1526 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21327] It is appreciated that VGAM1526 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1526 host target genes. The mRNA of each one of this plurality of VGAM1526 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1526 RNA, herein designated VGAM RNA, and which when bound by VGAM1526 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1526 host target proteins.

[21328] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1526 gene, herein designated VGAM GENE, on one or more VGAM1526 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21329] It is yet further appreciated that a function of VGAM1526 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1526 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM1526 correlate with, and may be deduced from, the identity of the host target genes which VGAM1526 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21330] Nucleotide sequences of the VGAM1526 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1526 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1526 are further described hereinbelow with reference to Table 1.

[21331] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1526 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21332] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1527 (VGAM1527) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21333] VGAM1527 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1527 was detected is described hereinabove with reference to Figs. 2-8.

[21334] VGAM1527 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox virus. VGAM1527 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21335] VGAM1527 gene, herein designated VGAM GENE, encodes a VGAM1527 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1527 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1527 precursor RNA is designated SEQ ID:1513, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1513 is located at position 68087 relative to the genome of Camelpox virus.

[21336] VGAM1527 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21337] An enzyme complex designated DICER COMPLEX, dices the VGAM1527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1527 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM1527 RNA is designated SEQ ID:4238, and is provided hereinbelow with reference to the sequence listing part.

[21338] VGAM1527 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1527 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1527 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21339] VGAM1527 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1527 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1527 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1527 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1527 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21340] The complementary binding of VGAM1527 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1527 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1527 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1527 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21341] It is appreciated that VGAM1527 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1527 host target genes. The mRNA of each one of this plurality of VGAM1527 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1527 RNA, herein designated VGAM RNA, and which when bound by VGAM1527 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1527 host target proteins.

[21342] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1527 gene, herein designated VGAM GENE, on one or more VGAM1527 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21343] It is yet further appreciated that a function of VGAM1527 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1527 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1527 correlate with, and may be deduced from, the identity of the host target genes which VGAM1527 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21344] Nucleotide sequences of the VGAM1527 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1527 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1527 are further described hereinbelow with reference to Table 1.

[21345] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1527 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21346] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1528 (VGAM1528) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21347] VGAM1528 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1528 was detected is described hereinabove with reference to Figs. 2-8.

[21348] VGAM1528 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM1528 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21349] VGAM1528 gene, herein designated VGAM GENE, encodes a VGAM1528 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1528 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1528 precursor RNA is designated SEQ ID:1514, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1514 is located at position 72786 relative to the genome of Ectromelia virus.

[21350] VGAM1528 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21351] An enzyme complex designated DICER COMPLEX, dices the VGAM1528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1528 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1528 RNA is designated SEQ ID:4239, and is provided hereinbelow with reference to the sequence listing part.

[21352] VGAM1528 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1528 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1528 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[21353] VGAM1528 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1528 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1528 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1528 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1528 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21354] The complementary binding of VGAM1528 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1528 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1528 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1528 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21355] It is appreciated that VGAM1528 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1528 host target genes. The mRNA of each one of this plurality of VGAM1528 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1528 RNA, herein designated VGAM RNA, and which when bound by VGAM1528 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1528 host target proteins.

[21356] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1528 gene, herein designated VGAM GENE, on one

or more VGAM1528 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21357] It is yet further appreciated that a function of VGAM1528 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1528 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM1528 correlate with, and may be deduced from, the identity of the host target genes which VGAM1528 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21358] Nucleotide sequences of the VGAM1528 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1528 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1528 are further described hereinbelow with reference to Table 1.

[21359] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1528 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21360] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1529 (VGAM1529) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21361] VGAM1529 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1529 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[21362] VGAM1529 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM1529 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21363] VGAM1529 gene, herein designated VGAM GENE, encodes a VGAM1529 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1529 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1529 precursor RNA is designated SEQ ID:1515, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1515 is located at position 69246 relative to the genome of Ectromelia virus.

[21364] VGAM1529 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21365] An enzyme complex designated DICER COMPLEX, dices the VGAM1529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1529 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1529 RNA is designated SEQ ID:4240, and is provided hereinbelow with reference to the sequence listing part.

[21366] VGAM1529 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1529 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1529 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21367] VGAM1529 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1529 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1529 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1529 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1529 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[21368] The complementary binding of VGAM1529 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1529 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1529 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1529 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21369] It is appreciated that VGAM1529 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1529 host target genes. The mRNA of each one of this plurality of VGAM1529 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1529 RNA, herein designated VGAM RNA, and which when bound by VGAM1529 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1529 host target proteins.

[21370] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1529 gene, herein designated VGAM GENE, on one or more VGAM1529 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21371] It is yet further appreciated that a function of VGAM1529 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1529 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM1529 correlate with, and may be deduced from, the identity of the host target genes which VGAM1529 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[21372] Nucleotide sequences of the VGAM1529 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1529 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1529 are further described hereinbelow with reference to Table 1.

[21373] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1529 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21374] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1530 (VGAM1530) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21375] VGAM1530 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1530 was detected is described hereinabove with reference to Figs. 2-8.

[21376] VGAM1530 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM1530 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21377] VGAM1530 gene, herein designated VGAM GENE, encodes a VGAM1530 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1530 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1530 precursor RNA is designated SEQ ID:1516, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1516 is located at position 73081 relative to the genome of Ectromelia virus.

[21378] VGAM1530 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21379] An enzyme complex designated DICER COMPLEX, dices the VGAM1530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1530 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1530 RNA is designated SEQ ID:4241, and is provided hereinbelow with reference to the sequence listing part.

[21380] VGAM1530 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1530 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1530 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21381] VGAM1530 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1530 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1530 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1530 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1530 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21382] The complementary binding of VGAM1530 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1530 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1530 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1530 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21383] It is appreciated that VGAM1530 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1530 host target genes. The mRNA of each one of this plurality of VGAM1530 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1530 RNA, herein designated VGAM RNA, and which when bound by VGAM1530 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1530 host target proteins.

[21384] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1530 gene, herein designated VGAM GENE, on one or more VGAM1530 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21385] It is yet further appreciated that a function of VGAM1530 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1530 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM1530 correlate with, and may be deduced from, the identity of the host target genes which VGAM1530 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[21386] Nucleotide sequences of the VGAM1530 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1530 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1530 are further described hereinbelow with reference to Table 1.

[21387] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1530 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21388] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1531 (VGAM1531) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21389] VGAM1531 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1531 was detected is described hereinabove with reference to Figs. 2-8.

[21390] VGAM1531 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM1531 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21391] VGAM1531 gene, herein designated VGAM GENE, encodes a VGAM1531 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1531 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1531 precursor RNA is designated SEQ ID:1517, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1517 is located at position 66901 relative to the genome of Ectromelia virus.

[21392] VGAM1531 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21393] An enzyme complex designated DICER COMPLEX, dices the VGAM1531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1531 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1531 RNA is designated SEQ ID:4242, and is provided hereinbelow with reference to the sequence listing part.

[21394] VGAM1531 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1531 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1531 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21395] VGAM1531 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1531 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1531 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1531 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1531 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21396] The complementary binding of VGAM1531 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1531 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1531 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1531 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21397] It is appreciated that VGAM1531 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1531 host target genes. The mRNA of each one of this plurality of VGAM1531 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1531 RNA, herein designated VGAM RNA, and which when bound by VGAM1531 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1531 host target proteins.

[21398] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1531 gene, herein designated VGAM GENE, on one or more VGAM1531 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21399] It is yet further appreciated that a function of VGAM1531 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1531 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM1531 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1531 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21400] Nucleotide sequences of the VGAM1531 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1531 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1531 are further described hereinbelow with reference to Table 1.

[21401] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1531 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21402] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1532 (VGAM1532) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21403] VGAM1532 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1532 was detected is described hereinabove with reference to Figs. 2-8.

[21404] VGAM1532 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM1532 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21405] VGAM1532 gene, herein designated VGAM GENE, encodes a VGAM1532 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1532 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1532 precursor RNA is designated SEQ ID:1518, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1518 is located at position 83358 relative to the genome of Cowpox virus.

[21406] VGAM1532 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1532 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21407] An enzyme complex designated DICER COMPLEX, dices the VGAM1532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1532 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1532 RNA is designated SEQ ID:4243, and is provided hereinbelow with reference to the sequence listing part.

[21408] VGAM1532 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1532 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1532 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21409] VGAM1532 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1532 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1532 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1532 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1532 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21410] The complementary binding of VGAM1532 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1532 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1532 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1532 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21411] It is appreciated that VGAM1532 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1532 host target genes. The mRNA of each one of this plurality of VGAM1532 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1532 RNA, herein designated VGAM RNA, and which when bound by VGAM1532 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1532 host target proteins.

[21412] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1532 gene, herein designated VGAM GENE, on one or more VGAM1532 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21413] It is yet further appreciated that a function of VGAM1532 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1532 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1532 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1532 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21414] Nucleotide sequences of the VGAM1532 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1532 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1532 are further described hereinbelow with reference to Table 1.

[21415] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1532 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21416] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1533 (VGAM1533) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[21417] VGAM1533 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1533 was detected is described hereinabove with reference to Figs. 2-8.

[21418] VGAM1533 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM1533 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21419] VGAM1533 gene, herein designated VGAM GENE, encodes a VGAM1533 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1533 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1533 precursor RNA is designated SEQ ID:1519, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1519 is located at position 82024 relative to the genome of Cowpox virus.

[21420] VGAM1533 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21421] An enzyme complex designated DICER COMPLEX, dices the VGAM1533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1533 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1533 RNA is designated SEQ ID:4244, and is provided hereinbelow with reference to the sequence listing part.

[21422] VGAM1533 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1533 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1533 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[21423] VGAM1533 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1533 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1533 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1533 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21424] The complementary binding of VGAM1533 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1533 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1533 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1533 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21425] It is appreciated that VGAM1533 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1533 host target genes. The mRNA of each one of this plurality of VGAM1533 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1533 RNA, herein designated VGAM RNA, and which when bound by VGAM1533 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1533 host target proteins.

[21426] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1533 gene, herein designated VGAM GENE, on one

or more VGAM1533 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21427] It is yet further appreciated that a function of VGAM1533 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1533 correlate with, and may be deduced from, the identity of the host target genes which VGAM1533 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21428] Nucleotide sequences of the VGAM1533 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1533 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1533 are further described hereinbelow with reference to Table 1.

[21429] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1533 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21430] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1534 (VGAM1534) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21431] VGAM1534 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1534 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[21432] VGAM1534 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM1534 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21433] VGAM1534 gene, herein designated VGAM GENE, encodes a VGAM1534 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1534 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1534 precursor RNA is designated SEQ ID:1520, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1520 is located at position 80718 relative to the genome of Cowpox virus.

[21434] VGAM1534 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21435] An enzyme complex designated DICER COMPLEX, dices the VGAM1534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1534 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1534 RNA is designated SEQ ID:4245, and is provided hereinbelow with reference to the sequence listing part.

[21436] VGAM1534 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1534 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1534 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21437] VGAM1534 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1534 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1534 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1534 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1534 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[21438] The complementary binding of VGAM1534 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1534 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1534 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1534 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21439] It is appreciated that VGAM1534 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1534 host target genes. The mRNA of each one of this plurality of VGAM1534 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1534 RNA, herein designated VGAM RNA, and which when bound by VGAM1534 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1534 host target proteins.

[21440] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1534 gene, herein designated VGAM GENE, on one or more VGAM1534 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21441] It is yet further appreciated that a function of VGAM1534 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1534 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1534 correlate with, and may be deduced from, the identity of the host target genes which VGAM1534 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[21442] Nucleotide sequences of the VGAM1534 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1534 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1534 are further described hereinbelow with reference to Table 1.

[21443] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1534 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21444] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1535 (VGAM1535) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21445] VGAM1535 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1535 was detected is described hereinabove with reference to Figs. 2-8.

[21446] VGAM1535 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM1535 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21447] VGAM1535 gene, herein designated VGAM GENE, encodes a VGAM1535 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1535 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1535 precursor RNA is designated SEQ ID:1521, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1521 is located at position 80457 relative to the genome of Cowpox virus.

[21448] VGAM1535 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21449] An enzyme complex designated DICER COMPLEX, dices the VGAM1535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1535 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1535 RNA is designated SEQ ID:4246, and is provided hereinbelow with reference to the sequence listing part.

[21450] VGAM1535 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1535 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1535 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21451] VGAM1535 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1535 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1535 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1535 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1535 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21452] The complementary binding of VGAM1535 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1535 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1535 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1535 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21453] It is appreciated that VGAM1535 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1535 host target genes. The mRNA of each one of this plurality of VGAM1535 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1535 RNA, herein designated VGAM RNA, and which when bound by VGAM1535 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1535 host target proteins.

[21454] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1535 gene, herein designated VGAM GENE, on one or more VGAM1535 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21455] It is yet further appreciated that a function of VGAM1535 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1535 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1535 correlate with, and may be deduced from, the identity of the host target genes which VGAM1535 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[21456] Nucleotide sequences of the VGAM1535 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1535 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1535 are further described hereinbelow with reference to Table 1.

[21457] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1535 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21458] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1536 (VGAM1536) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21459] VGAM1536 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1536 was detected is described hereinabove with reference to Figs. 2-8.

[21460] VGAM1536 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM1536 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21461] VGAM1536 gene, herein designated VGAM GENE, encodes a VGAM1536 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1536 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1536 precursor RNA is designated SEQ ID:1522, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1522 is located at position 77166 relative to the genome of Cowpox virus.

[21462] VGAM1536 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21463] An enzyme complex designated DICER COMPLEX, dices the VGAM1536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1536 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1536 RNA is designated SEQ ID:4247, and is provided hereinbelow with reference to the sequence listing part.

[21464] VGAM1536 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1536 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1536 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21465] VGAM1536 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1536 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1536 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1536 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1536 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21466] The complementary binding of VGAM1536 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1536 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1536 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1536 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21467] It is appreciated that VGAM1536 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1536 host target genes. The mRNA of each one of this plurality of VGAM1536 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1536 RNA, herein designated VGAM RNA, and which when bound by VGAM1536 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1536 host target proteins.

[21468] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1536 gene, herein designated VGAM GENE, on one or more VGAM1536 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21469] It is yet further appreciated that a function of VGAM1536 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1536 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1536 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1536 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21470] Nucleotide sequences of the VGAM1536 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1536 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1536 are further described hereinbelow with reference to Table 1.

[21471] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1536 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21472] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1537 (VGAM1537) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21473] VGAM1537 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1537 was detected is described hereinabove with reference to Figs. 2-8.

[21474] VGAM1537 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM1537 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21475] VGAM1537 gene, herein designated VGAM GENE, encodes a VGAM1537 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1537 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1537 precursor RNA is designated SEQ ID:1523, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1523 is located at position 78285 relative to the genome of Cowpox virus.

[21476] VGAM1537 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1537 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21477] An enzyme complex designated DICER COMPLEX, dices the VGAM1537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1537 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1537 RNA is designated SEQ ID:4248, and is provided hereinbelow with reference to the sequence listing part.

[21478] VGAM1537 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1537 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1537 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21479] VGAM1537 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1537 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1537 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1537 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1537 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21480] The complementary binding of VGAM1537 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1537 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1537 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1537 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21481] It is appreciated that VGAM1537 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1537 host target genes. The mRNA of each one of this plurality of VGAM1537 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1537 RNA, herein designated VGAM RNA, and which when bound by VGAM1537 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1537 host target proteins.

[21482] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1537 gene, herein designated VGAM GENE, on one or more VGAM1537 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21483] It is yet further appreciated that a function of VGAM1537 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1537 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1537 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1537 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21484] Nucleotide sequences of the VGAM1537 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1537 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1537 are further described hereinbelow with reference to Table 1.

[21485] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1537 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21486] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1538 (VGAM1538) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[21487] VGAM1538 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1538 was detected is described hereinabove with reference to Figs. 2-8.

[21488] VGAM1538 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM1538 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21489] VGAM1538 gene, herein designated VGAM GENE, encodes a VGAM1538 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1538 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1538 precursor RNA is designated SEQ ID:1524, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1524 is located at position 59766 relative to the genome of Monkeypox virus.

[21490] VGAM1538 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1538 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21491] An enzyme complex designated DICER COMPLEX, dices the VGAM1538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1538 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1538 RNA is designated SEQ ID:4249, and is provided hereinbelow with reference to the sequence listing part.

[21492] VGAM1538 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1538 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1538 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21493] VGAM1538 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1538 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1538 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1538 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1538 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21494] The complementary binding of VGAM1538 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1538 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1538 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1538 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21495] It is appreciated that VGAM1538 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1538 host target genes. The mRNA of each one of this plurality of VGAM1538 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1538 RNA, herein designated VGAM RNA, and which when bound by VGAM1538 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1538 host target proteins.

[21496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1538 gene, herein designated VGAM GENE, on one or more VGAM1538 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21497] It is yet further appreciated that a function of VGAM1538 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1538 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific

functions, and accordingly utilities, of VGAM1538 correlate with, and may be deduced from, the identity of the host target genes which VGAM1538 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21498] Nucleotide sequences of the VGAM1538 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1538 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1538 are further described hereinbelow with reference to Table 1.

[21499] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1538 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21500] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1539 (VGAM1539) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[21501] VGAM1539 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1539 was detected is described hereinabove with reference to Figs. 2-8.

[21502] VGAM1539 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM1539 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21503] VGAM1539 gene, herein designated VGAM GENE, encodes a VGAM1539 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1539 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1539 precursor RNA is designated SEQ ID:1525, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1525 is located at position 60492 relative to the genome of Monkeypox virus.

[21504] VGAM1539 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21505] An enzyme complex designated DICER COMPLEX, dices the VGAM1539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1539 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1539 RNA is designated SEQ ID:4250, and is provided hereinbelow with reference to the sequence listing part.

[21506] VGAM1539 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1539 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1539 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21507] VGAM1539 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1539 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1539 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1539 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1539 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21508] The complementary binding of VGAM1539 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1539 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1539 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1539 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21509] It is appreciated that VGAM1539 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1539 host target genes. The mRNA of each one of this plurality of VGAM1539 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1539 RNA, herein designated VGAM RNA, and which when bound by VGAM1539 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1539 host target proteins.

[21510] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1539 gene, herein designated VGAM GENE, on one or more VGAM1539 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21511] It is yet further appreciated that a function of VGAM1539 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1539 include diagnosis, prevention and

treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM1539 correlate with, and may be deduced from, the identity of the host target genes which VGAM1539 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21512] Nucleotide sequences of the VGAM1539 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1539 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1539 are further described hereinbelow with reference to Table 1.

[21513] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1539 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21514] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1540 (VGAM1540) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21515] VGAM1540 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1540 was detected is described hereinabove with reference to Figs. 2-8.

[21516] VGAM1540 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM1540 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21517] VGAM1540 gene, herein designated VGAM GENE, encodes a VGAM1540 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1540 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1540 precursor RNA is designated SEQ ID:1526, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1526 is located at position 61618 relative to the genome of Monkeypox virus.

[21518] VGAM1540 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21519] An enzyme complex designated DICER COMPLEX, dices the VGAM1540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1540 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1540 RNA is designated SEQ ID:4251, and is provided hereinbelow with reference to the sequence listing part.

[21520] VGAM1540 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1540 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1540 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21521] VGAM1540 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1540 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1540 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1540 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1540 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21522] The complementary binding of VGAM1540 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1540 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1540 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1540 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21523] It is appreciated that VGAM1540 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1540 host target genes. The mRNA of each one of this plurality of VGAM1540 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1540 RNA, herein designated VGAM

RNA, and which when bound by VGAM1540 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1540 host target proteins.

[21524] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1540 gene, herein designated VGAM GENE, on one or more VGAM1540 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21525] It is yet further appreciated that a function of VGAM1540 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1540 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM1540 correlate with, and may be deduced from, the identity of the host target genes which VGAM1540 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21526] Nucleotide sequences of the VGAM1540 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1540 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1540 are further described hereinbelow with reference to Table 1.

[21527] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1540 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21528] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1541 (VGAM1541) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21529] VGAM1541 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1541 was detected is described hereinabove with reference to Figs. 2-8.

[21530] VGAM1541 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM1541 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21531] VGAM1541 gene, herein designated VGAM GENE, encodes a VGAM1541 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1541 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1541 precursor RNA is designated SEQ ID:1527, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1527 is located at position

63264 relative to the genome of Monkeypox virus.

[21532] VGAM1541 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21533] An enzyme complex designated DICER COMPLEX, dices the VGAM1541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1541 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1541 RNA is designated SEQ ID:4252, and is provided hereinbelow with reference to the sequence listing part.

[21534] VGAM1541 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1541 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1541 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21535] VGAM1541 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1541 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1541 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1541 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21536] The complementary binding of VGAM1541 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1541 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1541 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1541 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21537] It is appreciated that VGAM1541 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1541 host target genes. The mRNA of each one of this plurality of VGAM1541 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1541 RNA, herein designated VGAM RNA, and which when bound by VGAM1541 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1541 host target proteins.

[21538] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1541 gene, herein designated VGAM GENE, on one or more VGAM1541 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21539] It is yet further appreciated that a function of VGAM1541 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM1541 correlate with, and may be deduced from, the identity of the host target genes which VGAM1541 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21540] Nucleotide sequences of the VGAM1541 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1541 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1541 are further described hereinbelow with reference to Table 1.

[21541] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1541 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21542] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1542 (VGAM1542) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21543] VGAM1542 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1542 was detected is described hereinabove with reference to Figs. 2-8.

[21544] VGAM1542 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1542 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21545] VGAM1542 gene, herein designated VGAM GENE, encodes a VGAM1542 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1542 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1542 precursor RNA is designated SEQ ID:1528, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1528 is located at position

56199 relative to the genome of Variola virus.

[21546] VGAM1542 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21547] An enzyme complex designated DICER COMPLEX, dices the VGAM1542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1542 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1542 RNA is designated SEQ ID:4253, and is provided hereinbelow with reference to the sequence listing part.

[21548] VGAM1542 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1542 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1542 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21549] VGAM1542 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1542 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1542 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1542 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1542 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21550] The complementary binding of VGAM1542 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1542 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1542 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1542 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21551] It is appreciated that VGAM1542 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1542 host target genes. The mRNA of each one of this plurality of VGAM1542 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1542 RNA, herein designated VGAM RNA, and which when bound by VGAM1542 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1542 host target proteins.

[21552] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1542 gene, herein designated VGAM GENE, on one or more VGAM1542 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21553] It is yet further appreciated that a function of VGAM1542 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1542 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1542 correlate with, and may be deduced from, the identity of the host target genes which VGAM1542 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21554] Nucleotide sequences of the VGAM1542 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1542 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1542 are further described hereinbelow with reference to Table 1.

[21555] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1542 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21556] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1543 (VGAM1543) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21557] VGAM1543 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1543 was detected is described hereinabove with reference to Figs. 2-8.

[21558] VGAM1543 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM1543 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21559] VGAM1543 gene, herein designated VGAM GENE, encodes a VGAM1543 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1543 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1543 precursor RNA is designated SEQ ID:1529, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1529 is located at position 66348 relative to the genome of Vaccinia virus.

[21560] VGAM1543 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21561] An enzyme complex designated DICER COMPLEX, dices the VGAM1543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1543 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1543 RNA is designated SEQ ID:4254, and is provided hereinbelow with reference to the sequence

listing part.

[21562] VGAM1543 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1543 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1543 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21563] VGAM1543 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1543 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1543 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1543 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21564] The complementary binding of VGAM1543 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1543 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1543 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1543 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21565] It is appreciated that VGAM1543 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1543 host target genes. The mRNA of each one of this plurality of VGAM1543 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1543 RNA, herein designated VGAM RNA, and which when bound by VGAM1543 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1543 host target proteins.

[21566] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1543 gene, herein designated VGAM GENE, on one or more VGAM1543 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21567] It is yet further appreciated that a function of VGAM1543

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM1543 correlate with, and may be deduced from, the identity of the host target genes which VGAM1543 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21568] Nucleotide sequences of the VGAM1543 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1543 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1543 are further described hereinbelow with reference to Table 1.

[21569] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1543 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21570] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1544 (VGAM1544) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21571] VGAM1544 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1544 was detected is described hereinabove with reference to Figs. 2-8.

[21572] VGAM1544 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1544 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21573] VGAM1544 gene, herein designated VGAM GENE, encodes a VGAM1544 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1544 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1544 precursor RNA is designated SEQ ID:1530, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1530 is located at position 50463 relative to the genome of Variola virus.

[21574] VGAM1544 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21575] An enzyme complex designated DICER COMPLEX, dices the VGAM1544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1544 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1544 RNA is designated SEQ ID:4255, and is provided hereinbelow with reference to the sequence

listing part.

[21576] VGAM1544 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1544 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1544 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21577] VGAM1544 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1544 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1544 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1544 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1544 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21578] The complementary binding of VGAM1544 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1544 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1544 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1544 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21579] It is appreciated that VGAM1544 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1544 host target genes. The mRNA of each one of this plurality of VGAM1544 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1544 RNA, herein designated VGAM RNA, and which when bound by VGAM1544 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1544 host target proteins.

[21580] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1544 gene, herein designated VGAM GENE, on one or more VGAM1544 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21581] It is yet further appreciated that a function of VGAM1544

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1544 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1544 correlate with, and may be deduced from, the identity of the host target genes which VGAM1544 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21582] Nucleotide sequences of the VGAM1544 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1544 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1544 are further described hereinbelow with reference to Table 1.

[21583] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1544 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21584] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1545 (VGAM1545) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21585] VGAM1545 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1545 was detected is described hereinabove with reference to Figs. 2-8.

[21586] VGAM1545 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1545 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21587] VGAM1545 gene, herein designated VGAM GENE, encodes a VGAM1545 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1545 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1545 precursor RNA is designated SEQ ID:1531, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1531 is located at position 53558 relative to the genome of Variola virus.

[21588] VGAM1545 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21589] An enzyme complex designated DICER COMPLEX, dices the VGAM1545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1545 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1545 RNA is designated SEQ ID:4256, and is provided hereinbelow with reference to the sequence

listing part.

[21590] VGAM1545 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1545 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1545 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21591] VGAM1545 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1545 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1545 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1545 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21592] The complementary binding of VGAM1545 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1545 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1545 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1545 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21593] It is appreciated that VGAM1545 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1545 host target genes. The mRNA of each one of this plurality of VGAM1545 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1545 RNA, herein designated VGAM RNA, and which when bound by VGAM1545 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1545 host target proteins.

[21594] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1545 gene, herein designated VGAM GENE, on one or more VGAM1545 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21595] It is yet further appreciated that a function of VGAM1545

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1545 correlate with, and may be deduced from, the identity of the host target genes which VGAM1545 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21596] Nucleotide sequences of the VGAM1545 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1545 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1545 are further described hereinbelow with reference to Table 1.

[21597] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1545 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21598] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1546 (VGAM1546) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21599] VGAM1546 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1546 was detected is described hereinabove with reference to Figs. 2-8.

[21600] VGAM1546 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1546 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21601] VGAM1546 gene, herein designated VGAM GENE, encodes a VGAM1546 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1546 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1546 precursor RNA is designated SEQ ID:1532, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1532 is located at position 51253 relative to the genome of Variola virus.

[21602] VGAM1546 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21603] An enzyme complex designated DICER COMPLEX, dices the VGAM1546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1546 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1546 RNA is designated SEQ ID:4257, and is provided hereinbelow with reference to the sequence

listing part.

[21604] VGAM1546 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1546 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1546 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21605] VGAM1546 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1546 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1546 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1546 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21606] The complementary binding of VGAM1546 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1546 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1546 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1546 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21607] It is appreciated that VGAM1546 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1546 host target genes. The mRNA of each one of this plurality of VGAM1546 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1546 RNA, herein designated VGAM RNA, and which when bound by VGAM1546 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1546 host target proteins.

[21608] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1546 gene, herein designated VGAM GENE, on one or more VGAM1546 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21609] It is yet further appreciated that a function of VGAM1546

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1546 correlate with, and may be deduced from, the identity of the host target genes which VGAM1546 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21610] Nucleotide sequences of the VGAM1546 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1546 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1546 are further described hereinbelow with reference to Table 1.

[21611] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1546 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21612] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1547 (VGAM1547) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21613] VGAM1547 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1547 was detected is described hereinabove with reference to Figs. 2-8.

[21614] VGAM1547 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM1547 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21615] VGAM1547 gene, herein designated VGAM GENE, encodes a VGAM1547 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1547 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1547 precursor RNA is designated SEQ ID:1533, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1533 is located at position 64695 relative to the genome of Vaccinia virus.

[21616] VGAM1547 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21617] An enzyme complex designated DICER COMPLEX, dices the VGAM1547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1547 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1547 RNA is designated SEQ ID:4258, and

is provided hereinbelow with reference to the sequence listing part.

[21618] VGAM1547 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1547 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1547 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21619] VGAM1547 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1547 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1547 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1547 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1547 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21620] The complementary binding of VGAM1547 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1547 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1547 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1547 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21621] It is appreciated that VGAM1547 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1547 host target genes. The mRNA of each one of this plurality of VGAM1547 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1547 RNA, herein designated VGAM RNA, and which when bound by VGAM1547 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1547 host target proteins.

[21622] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1547 gene, herein designated VGAM GENE, on one or more VGAM1547 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21623] It is yet further appreciated that a function of VGAM1547 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1547 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM1547 correlate with, and may be deduced from, the identity of the host target genes which VGAM1547 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21624] Nucleotide sequences of the VGAM1547 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1547 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1547 are further described hereinbelow with reference to Table 1.

[21625] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1547 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21626] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1548 (VGAM1548) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21627] VGAM1548 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1548 was detected is described hereinabove with reference to Figs. 2-8.

[21628] VGAM1548 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1548 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21629] VGAM1548 gene, herein designated VGAM GENE, encodes a VGAM1548 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1548 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1548 precur-

sor RNA is designated SEQ ID:1534, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1534 is located at position 113488 relative to the genome of Macaca mulatta rhadinovirus.

[21630] VGAM1548 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21631] An enzyme complex designated DICER COMPLEX, dices the VGAM1548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1548 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1548 RNA is designated SEQ ID:4259, and is provided hereinbelow with reference to the sequence listing part.

[21632] VGAM1548 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1548 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1548 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21633] VGAM1548 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1548 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1548 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1548 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1548 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21634] The complementary binding of VGAM1548 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1548 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1548 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1548 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21635] It is appreciated that VGAM1548 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1548 host target genes. The mRNA of each one of this plurality of VGAM1548 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1548 RNA, herein designated VGAM RNA, and which when bound by VGAM1548 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1548 host target proteins.

[21636] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1548 gene, herein designated VGAM GENE, on one or more VGAM1548 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21637] It is yet further appreciated that a function of VGAM1548 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1548 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1548 correlate with, and may be deduced from, the identity of the host target genes which VGAM1548 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21638] Nucleotide sequences of the VGAM1548 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1548 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1548 are further described hereinbelow with reference to Table 1.

[21639] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1548 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21640] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1549 (VGAM1549) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21641] VGAM1549 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1549 was detected is described hereinabove with reference to Figs. 2-8.

[21642] VGAM1549 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1549 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21643] VGAM1549 gene, herein designated VGAM GENE, encodes a VGAM1549 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1549 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1549 precursor RNA is designated SEQ ID:1535, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1535 is located at position 117267 relative to the genome of Macaca mulatta rhadinovirus.

[21644] VGAM1549 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21645] An enzyme complex designated DICER COMPLEX, dices the VGAM1549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1549 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1549 RNA is designated SEQ ID:4260, and is provided hereinbelow with reference to the sequence listing part.

[21646] VGAM1549 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1549 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1549 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21647] VGAM1549 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1549 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1549 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1549 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1549 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21648] The complementary binding of VGAM1549 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1549 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1549 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1549 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21649] It is appreciated that VGAM1549 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1549 host target genes. The mRNA of each one of this plurality of VGAM1549 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1549 RNA, herein designated VGAM RNA, and which when bound by VGAM1549 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1549 host target proteins.

[21650] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1549 gene, herein designated VGAM GENE, on one or more VGAM1549 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21651] It is yet further appreciated that a function of VGAM1549 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1549 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1549 correlate with, and may be deduced from, the identity of the host target genes which VGAM1549 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21652] Nucleotide sequences of the VGAM1549 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1549 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1549 are further described hereinbelow with reference to Table 1.

[21653] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1549 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21654] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1550 (VGAM1550) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21655] VGAM1550 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1550 was detected is described hereinabove with reference to Figs. 2-8.

[21656] VGAM1550 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1550 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21657] VGAM1550 gene, herein designated VGAM GENE, encodes a VGAM1550 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1550 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1550 precursor RNA is designated SEQ ID:1536, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1536 is located at position 114505 relative to the genome of Macaca mulatta rhadinovirus.

[21658] VGAM1550 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21659] An enzyme complex designated DICER COMPLEX, dices the VGAM1550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1550 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1550 RNA is designated SEQ ID:4261, and is provided hereinbelow with reference to the sequence listing part.

[21660] VGAM1550 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1550 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1550 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21661] VGAM1550 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1550 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1550 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1550 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1550 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21662] The complementary binding of VGAM1550 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1550 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1550 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1550 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21663] It is appreciated that VGAM1550 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1550 host target genes. The mRNA of each one of this plurality of VGAM1550 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1550 RNA, herein designated VGAM RNA, and which when bound by VGAM1550 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1550 host target proteins.

[21664] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1550 gene, herein designated VGAM GENE, on one or more VGAM1550 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21665] It is yet further appreciated that a function of VGAM1550 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1550 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1550 correlate with, and may be deduced from, the identity of the host target genes which VGAM1550 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21666] Nucleotide sequences of the VGAM1550 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1550 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1550 are further described hereinbelow with reference to Table 1.

[21667] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1550 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21668] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1551 (VGAM1551) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21669] VGAM1551 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1551 was detected is described hereinabove with reference to Figs. 2-8.

[21670] VGAM1551 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1551 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21671] VGAM1551 gene, herein designated VGAM GENE, encodes

a VGAM1551 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1551 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1551 precursor RNA is designated SEQ ID:1537, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1537 is located at position 113655 relative to the genome of Macaca mulatta rhadinovirus.

[21672] VGAM1551 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21673] An enzyme complex designated DICER COMPLEX, dices the VGAM1551 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1551 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1551 RNA is designated SEQ ID:4262, and is provided hereinbelow with reference to the sequence listing part.

[21674] VGAM1551 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1551 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1551 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21675] VGAM1551 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1551 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1551 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1551 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21676] The complementary binding of VGAM1551 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1551 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1551

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1551 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21677] It is appreciated that VGAM1551 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1551 host target genes. The mRNA of each one of this plurality of VGAM1551 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1551 RNA, herein designated VGAM RNA, and which when bound by VGAM1551 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1551 host target proteins.

[21678] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1551 gene, herein designated VGAM GENE, on one or more VGAM1551 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21679] It is yet further appreciated that a function of VGAM1551 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1551 correlate with, and may be deduced from, the identity of the host target genes which VGAM1551 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21680] Nucleotide sequences of the VGAM1551 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1551 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1551 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1551 are further described hereinbelow with reference to Table 1.

[21681] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1551 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21682] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1552 (VGAM1552) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21683] VGAM1552 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1552 was detected is described hereinabove with reference to Figs. 2-8.

[21684] VGAM1552 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1552 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[21685] VGAM1552 gene, herein designated VGAM GENE, encodes a VGAM1552 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1552 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1552 precursor RNA is designated SEQ ID:1538, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1538 is located at position 116594 relative to the genome of Macaca mulatta rhadinovirus.

[21686] VGAM1552 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21687] An enzyme complex designated DICER COMPLEX, dices the VGAM1552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1552 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1552 RNA is designated SEQ ID:4263, and is provided hereinbelow with reference to the sequence listing part.

[21688] VGAM1552 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1552 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1552 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21689] VGAM1552 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1552 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1552 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1552 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21690] The complementary binding of VGAM1552 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1552 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1552 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1552 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21691] It is appreciated that VGAM1552 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1552 host target genes. The mRNA of each one of this plurality of VGAM1552 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1552 RNA, herein designated VGAM RNA, and which when bound by VGAM1552 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1552 host target proteins.

[21692] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1552 gene, herein designated VGAM GENE, on one or more VGAM1552 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21693] It is yet further appreciated that a function of VGAM1552 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1552 correlate with, and may be deduced from, the identity of the host target genes which VGAM1552 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21694] Nucleotide sequences of the VGAM1552 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1552 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1552 are further described hereinbelow with reference to Table 1.

[21695] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1552 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21696] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1553 (VGAM1553) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21697] VGAM1553 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1553 was detected is described hereinabove with reference to Figs. 2-8.

[21698] VGAM1553 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadi-

novirus. VGAM1553 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21699] VGAM1553 gene, herein designated VGAM GENE, encodes a VGAM1553 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1553 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1553 precursor RNA is designated SEQ ID:1539, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1539 is located at position 113170 relative to the genome of Macaca mulatta rhadinovirus.

[21700] VGAM1553 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21701] An enzyme complex designated DICER COMPLEX, dices the VGAM1553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1553 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1553 RNA is designated SEQ ID:4264, and is provided hereinbelow with reference to the sequence listing part.

[21702] VGAM1553 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1553 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1553 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21703] VGAM1553 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1553 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1553 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1553 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1553 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21704] The complementary binding of VGAM1553 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1553 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1553 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1553 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21705] It is appreciated that VGAM1553 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1553 host target genes. The mRNA of each one of this plurality of VGAM1553 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1553 RNA, herein designated VGAM RNA, and which when bound by VGAM1553 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1553 host target proteins.

[21706] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1553 gene, herein designated VGAM GENE, on one or more VGAM1553 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21707] It is yet further appreciated that a function of VGAM1553 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1553 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1553 correlate with, and may be deduced from, the identity of the host target genes which VGAM1553 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21708] Nucleotide sequences of the VGAM1553 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1553 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1553 are further described hereinbelow with reference to Table 1.

[21709] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1553 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21710] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1554 (VGAM1554) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21711] VGAM1554 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1554 was detected is described hereinabove with reference to Figs. 2-8.

[21712] VGAM1554 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1554 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21713] VGAM1554 gene, herein designated VGAM GENE, encodes a VGAM1554 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1554 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1554 precursor RNA is designated SEQ ID:1540, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1540 is located at position 118520 relative to the genome of Macaca mulatta rhadinovirus.

[21714] VGAM1554 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21715] An enzyme complex designated DICER COMPLEX, dices the VGAM1554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1554 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1554 RNA is designated SEQ ID:4265, and is provided hereinbelow with reference to the sequence listing part.

[21716] VGAM1554 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1554 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1554 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21717] VGAM1554 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1554 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1554 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1554 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1554 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[21718] The complementary binding of VGAM1554 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1554 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1554 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1554 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21719] It is appreciated that VGAM1554 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1554 host target genes. The mRNA of each one of this plurality of VGAM1554 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1554 RNA, herein designated VGAM RNA, and which when bound by VGAM1554 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1554 host target proteins.

[21720] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1554 gene, herein designated VGAM GENE, on one or more VGAM1554 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21721] It is yet further appreciated that a function of VGAM1554 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1554 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1554 correlate with, and may be deduced from, the identity of the host target genes which VGAM1554 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[21722] Nucleotide sequences of the VGAM1554 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1554 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1554 are further described hereinbelow with reference to Table 1.

[21723] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1554 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21724] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1555 (VGAM1555) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21725] VGAM1555 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1555 was detected is described hereinabove with reference to Figs. 2-8.

[21726] VGAM1555 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1555 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21727] VGAM1555 gene, herein designated VGAM GENE, encodes a VGAM1555 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1555 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1555 precursor RNA is designated SEQ ID:1541, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1541 is located at position 118330 relative to the genome of Macaca mulatta rhadinovirus.

[21728] VGAM1555 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21729] An enzyme complex designated DICER COMPLEX, dices the VGAM1555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1555 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1555 RNA is designated SEQ ID:4266, and is provided hereinbelow with reference to the sequence listing part.

[21730] VGAM1555 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1555 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1555 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21731] VGAM1555 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1555 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1555 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1555 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1555 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21732] The complementary binding of VGAM1555 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1555 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1555 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1555 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21733] It is appreciated that VGAM1555 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1555 host target genes. The mRNA of each one of this plurality of VGAM1555 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1555 RNA, herein designated VGAM RNA, and which when bound by VGAM1555 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1555 host target proteins.

[21734] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1555 gene, herein designated VGAM GENE, on one or more VGAM1555 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21735] It is yet further appreciated that a function of VGAM1555 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1555 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1555 correlate with, and may be deduced from, the

identity of the host target genes which VGAM1555 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21736] Nucleotide sequences of the VGAM1555 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1555 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1555 are further described hereinbelow with reference to Table 1.

[21737] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1555 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21738] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1556 (VGAM1556) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21739] VGAM1556 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1556 was detected is described hereinabove with reference to Figs. 2-8.

[21740] VGAM1556 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1556 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21741] VGAM1556 gene, herein designated VGAM GENE, encodes a VGAM1556 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1556 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1556 precursor RNA is designated SEQ ID:1542, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1542 is located at position 114675 relative to the genome of Macaca mulatta rhadinovirus.

[21742] VGAM1556 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1556 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21743] An enzyme complex designated DICER COMPLEX, dices the VGAM1556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1556 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1556 RNA is designated SEQ ID:4267, and is provided hereinbelow with reference to the sequence listing part.

[21744] VGAM1556 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1556 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1556 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21745] VGAM1556 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1556 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1556 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1556 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1556 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21746] The complementary binding of VGAM1556 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1556 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1556 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1556 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21747] It is appreciated that VGAM1556 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1556 host target genes. The mRNA of each one of this plurality of VGAM1556 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1556 RNA, herein designated VGAM RNA, and which when bound by VGAM1556 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1556 host target proteins.

[21748] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1556 gene, herein designated VGAM GENE, on one or more VGAM1556 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21749] It is yet further appreciated that a function of VGAM1556 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadi-

novirus. Specific functions, and accordingly utilities, of VGAM1556 correlate with, and may be deduced from, the identity of the host target genes which VGAM1556 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21750] Nucleotide sequences of the VGAM1556 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1556 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1556 are further described hereinbelow with reference to Table 1.

[21751] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1556 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21752] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1557 (VGAM1557) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[21753] VGAM1557 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1557 was detected is described hereinabove with reference to Figs. 2-8.

[21754] VGAM1557 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1557 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21755] VGAM1557 gene, herein designated VGAM GENE, encodes a VGAM1557 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1557 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1557 precursor RNA is designated SEQ ID:1543, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1543 is located at position 114790 relative to the genome of Macaca mulatta rhadinovirus.

[21756] VGAM1557 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21757] An enzyme complex designated DICER COMPLEX, dices the VGAM1557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1557 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1557 RNA is designated SEQ ID:4268, and is provided hereinbelow with reference to the sequence listing part.

[21758] VGAM1557 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1557 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1557 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21759] VGAM1557 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1557 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1557 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1557 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1557 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21760] The complementary binding of VGAM1557 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1557 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1557 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1557 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21761] It is appreciated that VGAM1557 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1557 host target genes. The mRNA of each one of this plurality of VGAM1557 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1557 RNA, herein designated VGAM

RNA, and which when bound by VGAM1557 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1557 host target proteins.

[21762] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1557 gene, herein designated VGAM GENE, on one or more VGAM1557 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21763] It is yet further appreciated that a function of VGAM1557 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1557 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1557 correlate with, and may be deduced from, the identity of the host target genes which VGAM1557 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21764] Nucleotide sequences of the VGAM1557 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1557 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1557 are further described hereinbelow with reference to Table 1.

[21765] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1557 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21766] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1558 (VGAM1558) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21767] VGAM1558 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1558 was detected is described hereinabove with reference to Figs. 2-8.

[21768] VGAM1558 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic virus. VGAM1558 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21769] VGAM1558 gene, herein designated VGAM GENE, encodes a VGAM1558 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1558 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1558 precursor RNA is designated SEQ ID:1544, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1544 is located at position 8996

relative to the genome of Bean common mosaic virus.

[21770] VGAM1558 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21771] An enzyme complex designated DICER COMPLEX, dices the VGAM1558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1558 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1558 RNA is designated SEQ ID:4269, and is provided hereinbelow with reference to the sequence listing part.

[21772] VGAM1558 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1558 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1558 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21773] VGAM1558 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1558 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1558 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1558 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21774] The complementary binding of VGAM1558 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1558 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1558 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1558 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21775] It is appreciated that VGAM1558 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1558 host target genes. The mRNA of each one of this plurality of VGAM1558 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1558 RNA, herein designated VGAM RNA, and which when bound by VGAM1558 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1558 host target proteins.

[21776] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1558 gene, herein designated VGAM GENE, on one or more VGAM1558 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21777] It is yet further appreciated that a function of VGAM1558 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of viral infection by Bean common mosaic virus. Specific functions, and accordingly utilities, of VGAM1558 correlate with, and may be deduced from, the identity of the host target genes which VGAM1558 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21778] Nucleotide sequences of the VGAM1558 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1558 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1558 are further described hereinbelow with reference to Table 1.

[21779] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1558 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21780] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1559 (VGAM1559) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21781] VGAM1559 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1559 was detected is described hereinabove with reference to Figs. 2-8.

[21782] VGAM1559 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic virus. VGAM1559 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21783] VGAM1559 gene, herein designated VGAM GENE, encodes a VGAM1559 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1559 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1559 precursor RNA is designated SEQ ID:1545, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1545 is located at position 3572 relative to the genome of Bean common mosaic virus.

[21784] VGAM1559 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21785] An enzyme complex designated DICER COMPLEX, dices the VGAM1559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1559 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1559 RNA is designated SEQ ID:4270, and is provided hereinbelow with reference to the sequence

listing part.

[21786] VGAM1559 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1559 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1559 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21787] VGAM1559 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1559 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1559 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1559 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1559 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21788] The complementary binding of VGAM1559 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1559 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1559 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1559 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21789] It is appreciated that VGAM1559 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1559 host target genes. The mRNA of each one of this plurality of VGAM1559 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1559 RNA, herein designated VGAM RNA, and which when bound by VGAM1559 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1559 host target proteins.

[21790] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1559 gene, herein designated VGAM GENE, on one or more VGAM1559 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21791] It is yet further appreciated that a function of VGAM1559

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1559 include diagnosis, prevention and treatment of viral infection by Bean common mosaic virus. Specific functions, and accordingly utilities, of VGAM1559 correlate with, and may be deduced from, the identity of the host target genes which VGAM1559 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21792] Nucleotide sequences of the VGAM1559 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1559 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1559 are further described hereinbelow with reference to Table 1.

[21793] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1559 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21794] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1560 (VGAM1560) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21795] VGAM1560 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1560 was detected is described hereinabove with reference to Figs. 2-8.

[21796] VGAM1560 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic virus. VGAM1560 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21797] VGAM1560 gene, herein designated VGAM GENE, encodes a VGAM1560 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1560 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1560 precursor RNA is designated SEQ ID:1546, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1546 is located at position 6352 relative to the genome of Bean common mosaic virus.

[21798] VGAM1560 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21799] An enzyme complex designated DICER COMPLEX, dices the VGAM1560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1560 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1560 RNA is designated SEQ ID:4271, and

is provided hereinbelow with reference to the sequence listing part.

[21800] VGAM1560 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1560 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1560 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21801] VGAM1560 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1560 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1560 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1560 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1560 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21802] The complementary binding of VGAM1560 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1560 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1560 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1560 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21803] It is appreciated that VGAM1560 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1560 host target genes. The mRNA of each one of this plurality of VGAM1560 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1560 RNA, herein designated VGAM RNA, and which when bound by VGAM1560 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1560 host target proteins.

[21804] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1560 gene, herein designated VGAM GENE, on one or more VGAM1560 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21805] It is yet further appreciated that a function of VGAM1560 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1560 include diagnosis, prevention and treatment of viral infection by Bean common mosaic virus. Specific functions, and accordingly utilities, of VGAM1560 correlate with, and may be deduced from, the identity of the host target genes which VGAM1560 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21806] Nucleotide sequences of the VGAM1560 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1560 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1560 are further described hereinbelow with reference to Table 1.

[21807] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1560 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21808] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1561 (VGAM1561) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21809] VGAM1561 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1561 was detected is described hereinabove with reference to Figs. 2-8.

[21810] VGAM1561 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic virus. VGAM1561 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21811] VGAM1561 gene, herein designated VGAM GENE, encodes a VGAM1561 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1561 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1561 precur-

sor RNA is designated SEQ ID:1547, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1547 is located at position 7254 relative to the genome of Bean common mosaic virus.

[21812] VGAM1561 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21813] An enzyme complex designated DICER COMPLEX, dices the VGAM1561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1561 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide se-

quence of VGAM1561 RNA is designated SEQ ID:4272, and is provided hereinbelow with reference to the sequence listing part.

[21814] VGAM1561 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1561 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1561 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21815] VGAM1561 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1561 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1561 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1561 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1561 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21816] The complementary binding of VGAM1561 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1561 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1561 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1561 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21817] It is appreciated that VGAM1561 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1561 host target genes. The mRNA of

each one of this plurality of VGAM1561 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1561 RNA, herein designated VGAM RNA, and which when bound by VGAM1561 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1561 host target proteins.

[21818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1561 gene, herein designated VGAM GENE, on one or more VGAM1561 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[21819] It is yet further appreciated that a function of VGAM1561 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1561 include diagnosis, prevention and treatment of viral infection by Bean common mosaic virus. Specific functions, and accordingly utilities, of VGAM1561 correlate with, and may be deduced from, the identity of the host target genes which VGAM1561 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21820] Nucleotide sequences of the VGAM1561 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1561 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1561 are further described hereinbelow with reference to Table 1.

[21821] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1561 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[21822] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1562 (VGAM1562) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21823] VGAM1562 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1562 was detected is described hereinabove with reference to Figs. 2-8.

[21824] VGAM1562 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic virus. VGAM1562 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21825] VGAM1562 gene, herein designated VGAM GENE, encodes a VGAM1562 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1562 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1562 precursor RNA is designated SEQ ID:1548, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1548 is located at position 2292 relative to the genome of Bean common mosaic virus.

[21826] VGAM1562 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21827] An enzyme complex designated DICER COMPLEX, dices the VGAM1562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1562 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1562 RNA is designated SEQ ID:4273, and is provided hereinbelow with reference to the sequence listing part.

[21828] VGAM1562 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1562 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1562 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21829] VGAM1562 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1562 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1562 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1562 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21830] The complementary binding of VGAM1562 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1562 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1562 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1562 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21831] It is appreciated that VGAM1562 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1562 host target genes. The mRNA of each one of this plurality of VGAM1562 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1562 RNA, herein designated VGAM RNA, and which when bound by VGAM1562 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1562 host target proteins.

[21832] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1562 gene, herein designated VGAM GENE, on one or more VGAM1562 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21833] It is yet further appreciated that a function of VGAM1562 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of viral infection by Bean common mosaic virus. Specific functions, and accordingly utilities, of VGAM1562 correlate with, and may be deduced from, the identity of the host target genes which VGAM1562 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21834] Nucleotide sequences of the VGAM1562 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1562 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1562 are further described hereinbelow with reference to Table 1.

[21835] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1562 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21836] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1563 (VGAM1563) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21837] VGAM1563 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1563 was detected is described hereinabove with reference to Figs. 2-8.

[21838] VGAM1563 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic virus. VGAM1563 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21839] VGAM1563 gene, herein designated VGAM GENE, encodes a VGAM1563 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1563 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1563 precursor RNA is designated SEQ ID:1549, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1549 is located at position 9514 relative to the genome of Bean common mosaic virus.

[21840] VGAM1563 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21841] An enzyme complex designated DICER COMPLEX, dices the VGAM1563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1563 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1563 RNA is designated SEQ ID:4274, and is provided hereinbelow with reference to the sequence listing part.

[21842] VGAM1563 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1563 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1563 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21843] VGAM1563 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1563 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1563 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1563 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21844] The complementary binding of VGAM1563 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1563 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1563 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1563 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21845] It is appreciated that VGAM1563 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1563 host target genes. The mRNA of each one of this plurality of VGAM1563 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1563 RNA, herein designated VGAM RNA, and which when bound by VGAM1563 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1563 host target proteins.

[21846] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1563 gene, herein designated VGAM GENE, on one or more VGAM1563 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21847] It is yet further appreciated that a function of VGAM1563 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of viral infection by Bean common mosaic virus. Specific functions, and accordingly utilities, of VGAM1563 correlate with, and may be deduced from, the identity of the host target genes which VGAM1563 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21848] Nucleotide sequences of the VGAM1563 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1563 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1563 are further described hereinbelow with reference to Table 1.

[21849] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1563 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21850] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1564 (VGAM1564) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21851] VGAM1564 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1564 was detected is described hereinabove with reference to Figs. 2-8.

[21852] VGAM1564 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM1564 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21853] VGAM1564 gene, herein designated VGAM GENE, encodes a VGAM1564 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1564 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1564 precursor RNA is designated SEQ ID:1550, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1550 is located at position 167115 relative to the genome of Human herpesvirus 5.

[21854] VGAM1564 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21855] An enzyme complex designated DICER COMPLEX, dices the VGAM1564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1564 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1564 RNA is designated SEQ ID:4275, and is provided hereinbelow with reference to the sequence listing part.

[21856] VGAM1564 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1564 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1564 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21857] VGAM1564 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1564 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1564 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1564 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1564 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21858] The complementary binding of VGAM1564 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1564 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1564 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1564 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21859] It is appreciated that VGAM1564 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1564 host target genes. The mRNA of each one of this plurality of VGAM1564 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1564 RNA, herein designated VGAM RNA, and which when bound by VGAM1564 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1564 host target proteins.

[21860] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1564 gene, herein designated VGAM GENE, on one or more VGAM1564 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21861] It is yet further appreciated that a function of VGAM1564 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1564 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1564 correlate with, and may be deduced from, the identity of the host target genes which VGAM1564 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21862] Nucleotide sequences of the VGAM1564 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1564 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1564 are further described hereinbelow with reference to Table 1.

[21863] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1564 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21864] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1565 (VGAM1565) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21865] VGAM1565 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1565 was detected is described hereinabove with reference to Figs. 2-8.

[21866] VGAM1565 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM1565 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21867] VGAM1565 gene, herein designated VGAM GENE, encodes a VGAM1565 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1565 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1565 precursor RNA is designated SEQ ID:1551, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1551 is located at position 170917 relative to the genome of Human herpesvirus 5.

[21868] VGAM1565 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21869] An enzyme complex designated DICER COMPLEX, dices the VGAM1565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1565 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1565 RNA is designated SEQ ID:4276, and is provided hereinbelow with reference to the sequence listing part.

[21870] VGAM1565 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1565 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1565 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21871] VGAM1565 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1565 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1565 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1565 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21872] The complementary binding of VGAM1565 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1565 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1565 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1565 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[21873] It is appreciated that VGAM1565 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1565 host target genes. The mRNA of each one of this plurality of VGAM1565 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1565 RNA, herein designated VGAM RNA, and which when bound by VGAM1565 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1565 host target proteins.

[21874] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1565 gene, herein designated VGAM GENE, on one or more VGAM1565 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21875] It is yet further appreciated that a function of VGAM1565 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1565 correlate with, and may be deduced from, the identity of the host target genes which VGAM1565 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21876] Nucleotide sequences of the VGAM1565 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1565 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1565 are further described hereinbelow with reference to Table 1.

[21877] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1565 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21878] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1566 (VGAM1566) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21879] VGAM1566 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1566 was detected is described hereinabove with reference to Figs. 2-8.

[21880] VGAM1566 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM1566 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21881] VGAM1566 gene, herein designated VGAM GENE, encodes a VGAM1566 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1566 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1566 precursor RNA is designated SEQ ID:1552, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1552 is located at position 165653 relative to the genome of Human herpesvirus 5.

[21882] VGAM1566 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21883] An enzyme complex designated DICER COMPLEX, dices the VGAM1566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1566 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1566 RNA is designated SEQ ID:4277, and is provided hereinbelow with reference to the sequence listing part.

[21884] VGAM1566 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1566 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1566 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21885] VGAM1566 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1566 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1566 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1566 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1566 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21886] The complementary binding of VGAM1566 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1566 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1566 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1566 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21887] It is appreciated that VGAM1566 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1566 host target genes. The mRNA of each one of this plurality of VGAM1566 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1566 RNA, herein designated VGAM RNA, and which when bound by VGAM1566 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1566 host target proteins.

[21888] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1566 gene, herein designated VGAM GENE, on one or more VGAM1566 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21889] It is yet further appreciated that a function of VGAM1566 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1566 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1566 correlate with, and may be deduced from, the identity of the host target genes which VGAM1566 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21890] Nucleotide sequences of the VGAM1566 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1566 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1566 are further described hereinbelow with reference to Table 1.

[21891] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1566 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21892] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1567 (VGAM1567) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21893] VGAM1567 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1567 was detected is described hereinabove with reference to Figs. 2-8.

[21894] VGAM1567 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM1567 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21895] VGAM1567 gene, herein designated VGAM GENE, encodes

a VGAM1567 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1567 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1567 precursor RNA is designated SEQ ID:1553, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1553 is located at position 69308 relative to the genome of Human herpesvirus 5.

[21896] VGAM1567 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21897] An enzyme complex designated DICER COMPLEX, dices the VGAM1567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1567 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1567 RNA is designated SEQ ID:4278, and is provided hereinbelow with reference to the sequence listing part.

[21898] VGAM1567 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1567 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1567 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21899] VGAM1567 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1567 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1567 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1567 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1567 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21900] The complementary binding of VGAM1567 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1567 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1567 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1567 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21901] It is appreciated that VGAM1567 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1567 host target genes. The mRNA of each one of this plurality of VGAM1567 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1567 RNA, herein designated VGAM RNA, and which when bound by VGAM1567 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1567 host target proteins.

[21902] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1567 gene, herein designated VGAM GENE, on one or more VGAM1567 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21903] It is yet further appreciated that a function of VGAM1567 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1567 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1567 correlate with, and may be deduced from, the identity of the host target genes which VGAM1567 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21904] Nucleotide sequences of the VGAM1567 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1567 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1567 are further

described hereinbelow with reference to Table 1.

[21905] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1567 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21906] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1568 (VGAM1568) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21907] VGAM1568 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1568 was detected is described hereinabove with reference to Figs. 2-8.

[21908] VGAM1568 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM1568 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21909] VGAM1568 gene, herein designated VGAM GENE, encodes a VGAM1568 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1568 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1568 precursor RNA is designated SEQ ID:1554, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1554 is located at position 61146 relative to the genome of Human herpesvirus 5.

[21910] VGAM1568 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21911] An enzyme complex designated DICER COMPLEX, dices the VGAM1568 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1568 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1568 RNA is designated SEQ ID:4279, and is provided hereinbelow with reference to the sequence listing part.

[21912] VGAM1568 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1568 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1568 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21913] VGAM1568 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1568 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1568 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1568 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21914] The complementary binding of VGAM1568 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1568 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1568

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1568 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21915] It is appreciated that VGAM1568 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1568 host target genes. The mRNA of each one of this plurality of VGAM1568 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1568 RNA, herein designated VGAM RNA, and which when bound by VGAM1568 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1568 host target proteins.

[21916] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1568 gene, herein designated VGAM GENE, on one or more VGAM1568 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21917] It is yet further appreciated that a function of VGAM1568 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1568 correlate with, and may be deduced from, the identity of the host target genes which VGAM1568 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21918] Nucleotide sequences of the VGAM1568 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1568 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1568 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1568 are further described hereinbelow with reference to Table 1.

[21919] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1568 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21920] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1569 (VGAM1569) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21921] VGAM1569 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1569 was detected is described hereinabove with reference to Figs. 2-8.

[21922] VGAM1569 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM1569 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[21923] VGAM1569 gene, herein designated VGAM GENE, encodes a VGAM1569 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1569 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1569 precursor RNA is designated SEQ ID:1555, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1555 is located at position 66671 relative to the genome of Human herpesvirus 5.

[21924] VGAM1569 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21925] An enzyme complex designated DICER COMPLEX, dices

the VGAM1569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1569 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1569 RNA is designated SEQ ID:4280, and is provided hereinbelow with reference to the sequence listing part.

[21926] VGAM1569 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1569 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1569 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21927] VGAM1569 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1569 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1569 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1569 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1569 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21928] The complementary binding of VGAM1569 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1569 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1569 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1569 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21929] It is appreciated that VGAM1569 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1569 host target genes. The mRNA of each one of this plurality of VGAM1569 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1569 RNA, herein designated VGAM RNA, and which when bound by VGAM1569 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1569 host target proteins.

[21930] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1569 gene, herein designated VGAM GENE, on one or more VGAM1569 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21931] It is yet further appreciated that a function of VGAM1569 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1569 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1569 correlate with, and may be deduced from, the identity of the host target genes which VGAM1569 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21932] Nucleotide sequences of the VGAM1569 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1569 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1569 are further described hereinbelow with reference to Table 1.

[21933] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1569 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21934] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1570 (VGAM1570) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21935] VGAM1570 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1570 was detected is described hereinabove with reference to Figs. 2-8.

[21936] VGAM1570 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM1570 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[21937] VGAM1570 gene, herein designated VGAM GENE, encodes a VGAM1570 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1570 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1570 precursor RNA is designated SEQ ID:1556, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1556 is located at position 65530 relative to the genome of Human herpesvirus 5.

[21938] VGAM1570 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21939] An enzyme complex designated DICER COMPLEX, dices the VGAM1570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1570 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1570 RNA is designated SEQ ID:4281, and is provided hereinbelow with reference to the sequence listing part.

[21940] VGAM1570 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1570 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1570 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21941] VGAM1570 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1570 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1570 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1570 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1570 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21942] The complementary binding of VGAM1570 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1570 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1570 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1570 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21943] It is appreciated that VGAM1570 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1570 host target genes. The mRNA of each one of this plurality of VGAM1570 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1570 RNA, herein designated VGAM RNA, and which when bound by VGAM1570 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1570 host target proteins.

[21944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1570 gene, herein designated VGAM GENE, on one or more VGAM1570 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21945] It is yet further appreciated that a function of VGAM1570 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1570 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1570 correlate with, and may be deduced from, the identity of the host target genes which VGAM1570 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21946] Nucleotide sequences of the VGAM1570 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1570 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1570 are further described hereinbelow with reference to Table 1.

[21947] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1570 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21948] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1571 (VGAM1571) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21949] VGAM1571 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1571 was detected is described hereinabove with reference to Figs. 2-8.

[21950] VGAM1571 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum padi

virus. VGAM1571 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21951] VGAM1571 gene, herein designated VGAM GENE, encodes a VGAM1571 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1571 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1571 precursor RNA is designated SEQ ID:1557, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1557 is located at position 4 relative to the genome of Rhopalosiphum padi virus.

[21952] VGAM1571 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[21953] An enzyme complex designated DICER COMPLEX, dices the VGAM1571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1571 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1571 RNA is designated SEQ ID:4282, and is provided hereinbelow with reference to the sequence listing part.

[21954] VGAM1571 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1571 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1571 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21955] VGAM1571 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1571 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1571 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1571 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21956] The complementary binding of VGAM1571 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1571 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1571 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1571 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21957] It is appreciated that VGAM1571 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1571 host target genes. The mRNA of each one of this plurality of VGAM1571 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1571 RNA, herein designated VGAM RNA, and which when bound by VGAM1571 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1571 host target proteins.

[21958] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1571 gene, herein designated VGAM GENE, on one or more VGAM1571 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21959] It is yet further appreciated that a function of VGAM1571 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum padi virus. Specific functions, and accordingly utilities, of VGAM1571 correlate with, and may be deduced from, the identity of the host target genes which VGAM1571 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21960] Nucleotide sequences of the VGAM1571 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1571 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1571 are further described hereinbelow with reference to Table 1.

[21961] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1571 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21962] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1572 (VGAM1572) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21963] VGAM1572 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1572 was detected is described hereinabove with reference to Figs. 2-8.

[21964] VGAM1572 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Rhopalosiphum padi virus. VGAM1572 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21965] VGAM1572 gene, herein designated VGAM GENE, encodes a VGAM1572 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1572 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1572 precursor RNA is designated SEQ ID:1558, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1558 is located at position 3435 relative to the genome of Rhopalosiphum padi virus.

[21966] VGAM1572 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21967] An enzyme complex designated DICER COMPLEX, dices the VGAM1572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1572 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1572 RNA is designated SEQ ID:4283, and is provided hereinbelow with reference to the sequence listing part.

[21968] VGAM1572 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1572 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1572 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21969] VGAM1572 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1572 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1572 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1572 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1572 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21970] The complementary binding of VGAM1572 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1572 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1572 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1572 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21971] It is appreciated that VGAM1572 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1572 host target genes. The mRNA of each one of this plurality of VGAM1572 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1572 RNA, herein designated VGAM RNA, and which when bound by VGAM1572 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1572 host target proteins.

[21972] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1572 gene, herein designated VGAM GENE, on one or more VGAM1572 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21973] It is yet further appreciated that a function of VGAM1572 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1572 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum padi virus. Specific functions, and accordingly utilities, of VGAM1572 correlate with, and may be deduced from, the identity of the host target genes which VGAM1572 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21974] Nucleotide sequences of the VGAM1572 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1572 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1572 are further described hereinbelow with reference to Table 1.

[21975] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1572 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21976] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1573 (VGAM1573) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21977] VGAM1573 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1573 was detected is described hereinabove with reference to Figs. 2-8.

[21978] VGAM1573 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum padi virus. VGAM1573 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21979] VGAM1573 gene, herein designated VGAM GENE, encodes a VGAM1573 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1573 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1573 precursor RNA is designated SEQ ID:1559, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1559 is located at position 3711 relative to the genome of Rhopalosiphum padi virus.

[21980] VGAM1573 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21981] An enzyme complex designated DICER COMPLEX, dices the VGAM1573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1573 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1573 RNA is designated SEQ ID:4284, and is provided hereinbelow with reference to the sequence listing part.

[21982] VGAM1573 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1573 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1573 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[21983] VGAM1573 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1573 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1573 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1573 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1573 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21984] The complementary binding of VGAM1573 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1573 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1573 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1573 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21985] It is appreciated that VGAM1573 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1573 host target genes. The mRNA of each one of this plurality of VGAM1573 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1573 RNA, herein designated VGAM RNA, and which when bound by VGAM1573 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1573 host target proteins.

[21986] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1573 gene, herein designated VGAM GENE, on one

or more VGAM1573 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21987] It is yet further appreciated that a function of VGAM1573 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1573 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum padi virus. Specific functions, and accordingly utilities, of VGAM1573 correlate with, and may be deduced from, the identity of the host target genes which VGAM1573 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21988] Nucleotide sequences of the VGAM1573 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1573 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1573 are further described hereinbelow with reference to Table 1.

[21989] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1573 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21990] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1574 (VGAM1574) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21991] VGAM1574 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1574 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[21992] VGAM1574 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum padi virus. VGAM1574 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21993] VGAM1574 gene, herein designated VGAM GENE, encodes a VGAM1574 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1574 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1574 precursor RNA is designated SEQ ID:1560, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1560 is located at position 7836 relative to the genome of Rhopalosiphum padi virus.

[21994] VGAM1574 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21995] An enzyme complex designated DICER COMPLEX, dices the VGAM1574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1574 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1574 RNA is designated SEQ ID:4285, and is provided hereinbelow with reference to the sequence listing part.

[21996] VGAM1574 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1574 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1574 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21997] VGAM1574 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1574 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1574 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1574 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1574 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[21998] The complementary binding of VGAM1574 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1574 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1574 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1574 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21999] It is appreciated that VGAM1574 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1574 host target genes. The mRNA of each one of this plurality of VGAM1574 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1574 RNA, herein designated VGAM RNA, and which when bound by VGAM1574 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1574 host target proteins.

[22000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1574 gene, herein designated VGAM GENE, on one or more VGAM1574 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22001] It is yet further appreciated that a function of VGAM1574 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1574 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum padi virus. Specific functions, and accordingly utilities, of VGAM1574 correlate with, and may be deduced from, the identity of the host target genes which VGAM1574 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[22002] Nucleotide sequences of the VGAM1574 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1574 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1574 are further described hereinbelow with reference to Table 1.

[22003] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1574 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22004] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1575 (VGAM1575) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22005] VGAM1575 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1575 was detected is described hereinabove with reference to Figs. 2-8.

[22006] VGAM1575 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum padi virus. VGAM1575 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22007] VGAM1575 gene, herein designated VGAM GENE, encodes a VGAM1575 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1575 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1575 precursor RNA is designated SEQ ID:1561, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1561 is located at position 923 relative to the genome of Rhopalosiphum padi virus.

[22008] VGAM1575 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22009] An enzyme complex designated DICER COMPLEX, dices the VGAM1575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1575 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1575 RNA is designated SEQ ID:4286, and is provided hereinbelow with reference to the sequence listing part.

[22010] VGAM1575 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1575 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1575 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22011] VGAM1575 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1575 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1575 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1575 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22012] The complementary binding of VGAM1575 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1575 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1575 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1575 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22013] It is appreciated that VGAM1575 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1575 host target genes. The mRNA of each one of this plurality of VGAM1575 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1575 RNA, herein designated VGAM RNA, and which when bound by VGAM1575 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1575 host target proteins.

[22014] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1575 gene, herein designated VGAM GENE, on one or more VGAM1575 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22015] It is yet further appreciated that a function of VGAM1575 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum padi virus. Specific functions, and accordingly utilities, of VGAM1575 correlate with, and may be deduced from, the identity of the host target genes which VGAM1575 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[22016] Nucleotide sequences of the VGAM1575 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1575 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1575 are further described hereinbelow with reference to Table 1.

[22017] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1575 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22018] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1576 (VGAM1576) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22019] VGAM1576 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1576 was detected is described hereinabove with reference to Figs. 2-8.

[22020] VGAM1576 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum padi virus. VGAM1576 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22021] VGAM1576 gene, herein designated VGAM GENE, encodes a VGAM1576 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1576 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1576 precursor RNA is designated SEQ ID:1562, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1562 is located at position 3322 relative to the genome of Rhopalosiphum padi virus.

[22022] VGAM1576 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22023] An enzyme complex designated DICER COMPLEX, dices the VGAM1576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1576 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1576 RNA is designated SEQ ID:4287, and is provided hereinbelow with reference to the sequence listing part.

[22024] VGAM1576 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1576 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1576 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22025] VGAM1576 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1576 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1576 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1576 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1576 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22026] The complementary binding of VGAM1576 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1576 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1576 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1576 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22027] It is appreciated that VGAM1576 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1576 host target genes. The mRNA of each one of this plurality of VGAM1576 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1576 RNA, herein designated VGAM RNA, and which when bound by VGAM1576 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1576 host target proteins.

[22028] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1576 gene, herein designated VGAM GENE, on one or more VGAM1576 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22029] It is yet further appreciated that a function of VGAM1576 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1576 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum padi virus. Specific functions, and accordingly utilities, of VGAM1576 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1576 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22030] Nucleotide sequences of the VGAM1576 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1576 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1576 are further described hereinbelow with reference to Table 1.

[22031] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1576 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22032] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1577 (VGAM1577) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22033] VGAM1577 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1577 was detected is described hereinabove with reference to Figs. 2-8.

[22034] VGAM1577 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum padi virus. VGAM1577 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22035] VGAM1577 gene, herein designated VGAM GENE, encodes a VGAM1577 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1577 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1577 precursor RNA is designated SEQ ID:1563, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1563 is located at position 2545 relative to the genome of Rhopalosiphum padi virus.

[22036] VGAM1577 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1577 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22037] An enzyme complex designated DICER COMPLEX, dices the VGAM1577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1577 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1577 RNA is designated SEQ ID:4288, and is provided hereinbelow with reference to the sequence listing part.

[22038] VGAM1577 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1577 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1577 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22039] VGAM1577 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1577 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1577 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1577 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1577 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22040] The complementary binding of VGAM1577 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1577 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1577 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1577 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22041] It is appreciated that VGAM1577 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1577 host target genes. The mRNA of each one of this plurality of VGAM1577 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1577 RNA, herein designated VGAM RNA, and which when bound by VGAM1577 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1577 host target proteins.

[22042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1577 gene, herein designated VGAM GENE, on one or more VGAM1577 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22043] It is yet further appreciated that a function of VGAM1577 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1577 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum padi virus. Specific functions, and accordingly utilities, of VGAM1577

correlate with, and may be deduced from, the identity of the host target genes which VGAM1577 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22044] Nucleotide sequences of the VGAM1577 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1577 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1577 are further described hereinbelow with reference to Table 1.

[22045] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1577 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22046] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1578 (VGAM1578) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[22047] VGAM1578 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1578 was detected is described hereinabove with reference to Figs. 2-8.

[22048] VGAM1578 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum padi virus. VGAM1578 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22049] VGAM1578 gene, herein designated VGAM GENE, encodes a VGAM1578 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1578 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1578 precursor RNA is designated SEQ ID:1564, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1564 is located at position 3984 relative to the genome of Rhopalosiphum padi virus.

[22050] VGAM1578 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1578 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22051] An enzyme complex designated DICER COMPLEX, dices the VGAM1578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1578 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1578 RNA is designated SEQ ID:4289, and is provided hereinbelow with reference to the sequence listing part.

[22052] VGAM1578 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1578 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1578 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22053] VGAM1578 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1578 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1578 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1578 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22054] The complementary binding of VGAM1578 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1578 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1578 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1578 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22055] It is appreciated that VGAM1578 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1578 host target genes. The mRNA of each one of this plurality of VGAM1578 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1578 RNA, herein designated VGAM RNA, and which when bound by VGAM1578 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1578 host target proteins.

[22056] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1578 gene, herein designated VGAM GENE, on one or more VGAM1578 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22057] It is yet further appreciated that a function of VGAM1578 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum padi virus.

Specific functions, and accordingly utilities, of VGAM1578 correlate with, and may be deduced from, the identity of the host target genes which VGAM1578 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22058] Nucleotide sequences of the VGAM1578 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1578 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1578 are further described hereinbelow with reference to Table 1.

[22059] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1578 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22060] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1579 (VGAM1579) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[22061] VGAM1579 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1579 was detected is described hereinabove with reference to Figs. 2-8.

[22062] VGAM1579 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum padi virus. VGAM1579 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22063] VGAM1579 gene, herein designated VGAM GENE, encodes a VGAM1579 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1579 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1579 precursor RNA is designated SEQ ID:1565, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1565 is located at position 8880 relative to the genome of Rhopalosiphum padi virus.

[22064] VGAM1579 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22065] An enzyme complex designated DICER COMPLEX, dices the VGAM1579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1579 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1579 RNA is designated SEQ ID:4290, and is provided hereinbelow with reference to the sequence listing part.

[22066] VGAM1579 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1579 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1579 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22067] VGAM1579 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1579 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1579 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1579 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1579 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22068] The complementary binding of VGAM1579 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1579 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1579 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1579 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22069] It is appreciated that VGAM1579 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1579 host target genes. The mRNA of each one of this plurality of VGAM1579 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1579 RNA, herein designated VGAM RNA, and which when bound by VGAM1579 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1579 host target proteins.

[22070] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1579 gene, herein designated VGAM GENE, on one or more VGAM1579 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22071] It is yet further appreciated that a function of VGAM1579 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1579 include diagnosis, prevention and

treatment of viral infection by Rhopalosiphum padi virus. Specific functions, and accordingly utilities, of VGAM1579 correlate with, and may be deduced from, the identity of the host target genes which VGAM1579 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22072] Nucleotide sequences of the VGAM1579 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1579 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1579 are further described hereinbelow with reference to Table 1.

[22073] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1579 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22074] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1580 (VGAM1580) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22075] VGAM1580 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1580 was detected is described hereinabove with reference to Figs. 2-8.

[22076] VGAM1580 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum padi virus. VGAM1580 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22077] VGAM1580 gene, herein designated VGAM GENE, encodes a VGAM1580 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1580 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1580 precursor RNA is designated SEQ ID:1566, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1566 is located at position 8018 relative to the genome of Rhopalosiphum padi virus.

[22078] VGAM1580 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22079] An enzyme complex designated DICER COMPLEX, dices the VGAM1580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1580 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1580 RNA is designated SEQ ID:4291, and is provided hereinbelow with reference to the sequence listing part.

[22080] VGAM1580 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1580 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1580 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22081] VGAM1580 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1580 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1580 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1580 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1580 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22082] The complementary binding of VGAM1580 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1580 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1580 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1580 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22083] It is appreciated that VGAM1580 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1580 host target genes. The mRNA of each one of this plurality of VGAM1580 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1580 RNA, herein designated VGAM

RNA, and which when bound by VGAM1580 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1580 host target proteins.

[22084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1580 gene, herein designated VGAM GENE, on one or more VGAM1580 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22085] It is yet further appreciated that a function of VGAM1580 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1580 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum padi virus. Specific functions, and accordingly utilities, of VGAM1580 correlate with, and may be deduced from, the identity of the host target genes which VGAM1580 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22086] Nucleotide sequences of the VGAM1580 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1580 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1580 are further described hereinbelow with reference to Table 1.

[22087] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1580 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22088] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1581 (VGAM1581) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22089] VGAM1581 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1581 was detected is described hereinabove with reference to Figs. 2-8.

[22090] VGAM1581 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1581 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22091] VGAM1581 gene, herein designated VGAM GENE, encodes a VGAM1581 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1581 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1581 precursor RNA is designated SEQ ID:1567, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1567 is located at position

94704 relative to the genome of Saimiriine herpesvirus 2.

[22092] VGAM1581 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22093] An enzyme complex designated DICER COMPLEX, dices the VGAM1581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1581 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1581 RNA is designated SEQ ID:4292, and is provided hereinbelow with reference to the sequence listing part.

[22094] VGAM1581 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1581 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1581 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22095] VGAM1581 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1581 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1581 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1581 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1581 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22096] The complementary binding of VGAM1581 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1581 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1581 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1581 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22097] It is appreciated that VGAM1581 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1581 host target genes. The mRNA of each one of this plurality of VGAM1581 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1581 RNA, herein designated VGAM RNA, and which when bound by VGAM1581 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1581 host target proteins.

[22098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1581 gene, herein designated VGAM GENE, on one or more VGAM1581 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22099] It is yet further appreciated that a function of VGAM1581 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1581 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1581 correlate with, and may be deduced from, the identity of the host target genes which VGAM1581 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22100] Nucleotide sequences of the VGAM1581 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1581 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1581 are further described hereinbelow with reference to Table 1.

[22101] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1581 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22102] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1582 (VGAM1582) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22103] VGAM1582 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1582 was detected is described hereinabove with reference to Figs. 2-8.

[22104] VGAM1582 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1582 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22105] VGAM1582 gene, herein designated VGAM GENE, encodes a VGAM1582 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1582 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1582 precursor RNA is designated SEQ ID:1568, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1568 is located at position 90201 relative to the genome of Saimiriine herpesvirus 2.

[22106] VGAM1582 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22107] An enzyme complex designated DICER COMPLEX, dices the VGAM1582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1582 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1582 RNA is designated SEQ ID:4293, and is provided hereinbelow with reference to the sequence

listing part.

[22108] VGAM1582 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1582 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1582 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22109] VGAM1582 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1582 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1582 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1582 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22110] The complementary binding of VGAM1582 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1582 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1582 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1582 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22111] It is appreciated that VGAM1582 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1582 host target genes. The mRNA of each one of this plurality of VGAM1582 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1582 RNA, herein designated VGAM RNA, and which when bound by VGAM1582 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1582 host target proteins.

[22112] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1582 gene, herein designated VGAM GENE, on one or more VGAM1582 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22113] It is yet further appreciated that a function of VGAM1582

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1582 correlate with, and may be deduced from, the identity of the host target genes which VGAM1582 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22114] Nucleotide sequences of the VGAM1582 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1582 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1582 are further described hereinbelow with reference to Table 1.

[22115] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1582 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22116] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1583 (VGAM1583) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22117] VGAM1583 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1583 was detected is described hereinabove with reference to Figs. 2-8.

[22118] VGAM1583 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1583 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22119] VGAM1583 gene, herein designated VGAM GENE, encodes a VGAM1583 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1583 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1583 precursor RNA is designated SEQ ID:1569, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1569 is located at position 93157 relative to the genome of Saimiriine herpesvirus 2.

[22120] VGAM1583 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22121] An enzyme complex designated DICER COMPLEX, dices the VGAM1583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1583 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1583 RNA is designated SEQ ID:4294, and

is provided hereinbelow with reference to the sequence listing part.

[22122] VGAM1583 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1583 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1583 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22123] VGAM1583 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1583 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1583 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1583 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22124] The complementary binding of VGAM1583 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1583 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1583 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1583 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22125] It is appreciated that VGAM1583 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1583 host target genes. The mRNA of each one of this plurality of VGAM1583 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1583 RNA, herein designated VGAM RNA, and which when bound by VGAM1583 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1583 host target proteins.

[22126] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1583 gene, herein designated VGAM GENE, on one or more VGAM1583 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22127] It is yet further appreciated that a function of VGAM1583 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1583 correlate with, and may be deduced from, the identity of the host target genes which VGAM1583 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22128] Nucleotide sequences of the VGAM1583 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1583 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1583 are further described hereinbelow with reference to Table 1.

[22129] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1583 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22130] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1584 (VGAM1584) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22131] VGAM1584 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1584 was detected is described hereinabove with reference to Figs. 2-8.

[22132] VGAM1584 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1584 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22133] VGAM1584 gene, herein designated VGAM GENE, encodes a VGAM1584 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1584 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1584 precur-

sor RNA is designated SEQ ID:1570, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1570 is located at position 91273 relative to the genome of Saimiriine herpesvirus 2.

[22134] VGAM1584 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22135] An enzyme complex designated DICER COMPLEX, dices the VGAM1584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1584 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide se-

quence of VGAM1584 RNA is designated SEQ ID:4295, and is provided hereinbelow with reference to the sequence listing part.

[22136] VGAM1584 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1584 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1584 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22137] VGAM1584 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1584 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1584 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1584 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1584 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22138] The complementary binding of VGAM1584 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1584 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1584 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1584 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22139] It is appreciated that VGAM1584 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1584 host target genes. The mRNA of

each one of this plurality of VGAM1584 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1584 RNA, herein designated VGAM RNA, and which when bound by VGAM1584 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1584 host target proteins.

[22140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1584 gene, herein designated VGAM GENE, on one or more VGAM1584 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[22141] It is yet further appreciated that a function of VGAM1584 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1584 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1584 correlate with, and may be deduced from, the identity of the host target genes which VGAM1584 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22142] Nucleotide sequences of the VGAM1584 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1584 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1584 are further described hereinbelow with reference to Table 1.

[22143] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1584 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[22144] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1585 (VGAM1585) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22145] VGAM1585 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1585 was detected is described hereinabove with reference to Figs. 2-8.

[22146] VGAM1585 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1585 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22147] VGAM1585 gene, herein designated VGAM GENE, encodes a VGAM1585 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1585 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1585 precursor RNA is designated SEQ ID:1571, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1571 is located at position 87716 relative to the genome of Saimiriine herpesvirus 2.

[22148] VGAM1585 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22149] An enzyme complex designated DICER COMPLEX, dices the VGAM1585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1585 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1585 RNA is designated SEQ ID:4296, and is provided hereinbelow with reference to the sequence listing part.

[22150] VGAM1585 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1585 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1585 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22151] VGAM1585 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1585 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1585 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1585 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1585 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22152] The complementary binding of VGAM1585 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1585 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1585 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1585 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22153] It is appreciated that VGAM1585 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1585 host target genes. The mRNA of each one of this plurality of VGAM1585 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1585 RNA, herein designated VGAM RNA, and which when bound by VGAM1585 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1585 host target proteins.

[22154] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1585 gene, herein designated VGAM GENE, on one or more VGAM1585 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22155] It is yet further appreciated that a function of VGAM1585 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1585 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1585 correlate with, and may be deduced from, the identity of the host target genes which VGAM1585 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22156] Nucleotide sequences of the VGAM1585 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1585 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1585 are further described hereinbelow with reference to Table 1.

[22157] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1585 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22158] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1586 (VGAM1586) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22159] VGAM1586 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1586 was detected is described hereinabove with reference to Figs. 2-8.

[22160] VGAM1586 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1586 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22161] VGAM1586 gene, herein designated VGAM GENE, encodes a VGAM1586 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1586 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1586 precursor RNA is designated SEQ ID:1572, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1572 is located at position 86610 relative to the genome of Saimiriine herpesvirus 2.

[22162] VGAM1586 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22163] An enzyme complex designated DICER COMPLEX, dices the VGAM1586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1586 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM1586 RNA is designated SEQ ID:4297, and is provided hereinbelow with reference to the sequence listing part.

[22164] VGAM1586 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1586 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1586 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22165] VGAM1586 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1586 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1586 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1586 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22166] The complementary binding of VGAM1586 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1586 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1586 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1586 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22167] It is appreciated that VGAM1586 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1586 host target genes. The mRNA of each one of this plurality of VGAM1586 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1586 RNA, herein designated VGAM RNA, and which when bound by VGAM1586 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1586 host target proteins.

[22168] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1586 gene, herein designated VGAM GENE, on one or more VGAM1586 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22169] It is yet further appreciated that a function of VGAM1586 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1586 correlate with, and may be deduced from, the identity of the host target genes which VGAM1586 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22170] Nucleotide sequences of the VGAM1586 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1586 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1586 are further described hereinbelow with reference to Table 1.

[22171] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1586 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22172] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1587 (VGAM1587) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22173] VGAM1587 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1587 was detected is described hereinabove with reference to Figs. 2-8.

[22174] VGAM1587 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1587 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22175] VGAM1587 gene, herein designated VGAM GENE, encodes a VGAM1587 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1587 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1587 precursor RNA is designated SEQ ID:1573, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1573 is located at position 93438 relative to the genome of Saimiriine herpesvirus 2.

[22176] VGAM1587 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22177] An enzyme complex designated DICER COMPLEX, dices the VGAM1587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1587 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1587 RNA is designated SEQ ID:4298, and is provided hereinbelow with reference to the sequence listing part.

[22178] VGAM1587 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1587 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1587 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22179] VGAM1587 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1587 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1587 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1587 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1587 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22180] The complementary binding of VGAM1587 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1587 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1587 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1587 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22181] It is appreciated that VGAM1587 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1587 host target genes. The mRNA of each one of this plurality of VGAM1587 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1587 RNA, herein designated VGAM RNA, and which when bound by VGAM1587 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1587 host target proteins.

[22182] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1587 gene, herein designated VGAM GENE, on one or more VGAM1587 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22183] It is yet further appreciated that a function of VGAM1587 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1587 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1587 correlate with, and may be deduced from, the identity of the host target genes which VGAM1587 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22184] Nucleotide sequences of the VGAM1587 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1587 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1587 are further described hereinbelow with reference to Table 1.

[22185] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1587 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22186] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1588 (VGAM1588) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22187] VGAM1588 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1588 was detected is described hereinabove with reference to Figs. 2-8.

[22188] VGAM1588 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1588 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22189] VGAM1588 gene, herein designated VGAM GENE, encodes a VGAM1588 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1588 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1588 precursor RNA is designated SEQ ID:1574, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1574 is located at position 90393 relative to the genome of Saimiriine herpesvirus 2.

[22190] VGAM1588 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22191] An enzyme complex designated DICER COMPLEX, dices the VGAM1588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1588 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1588 RNA is designated SEQ ID:4299, and is provided hereinbelow with reference to the sequence listing part.

[22192] VGAM1588 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1588 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1588 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22193] VGAM1588 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1588 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1588 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1588 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22194] The complementary binding of VGAM1588 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1588 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1588 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1588 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[22195] It is appreciated that VGAM1588 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1588 host target genes. The mRNA of each one of this plurality of VGAM1588 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1588 RNA, herein designated VGAM RNA, and which when bound by VGAM1588 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1588 host target proteins.

[22196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1588 gene, herein designated VGAM GENE, on one or more VGAM1588 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22197] It is yet further appreciated that a function of VGAM1588 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1588 correlate with, and may be deduced from, the identity of the host target genes which VGAM1588 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22198] Nucleotide sequences of the VGAM1588 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1588 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1588 are further described hereinbelow with reference to Table 1.

[22199] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1588 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22200] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1589 (VGAM1589) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22201] VGAM1589 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1589 was detected is described hereinabove with reference to Figs. 2-8.

[22202] VGAM1589 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM1589 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22203] VGAM1589 gene, herein designated VGAM GENE, encodes a VGAM1589 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1589 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1589 precursor RNA is designated SEQ ID:1575, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1575 is located at position 88982 relative to the genome of Ateline herpesvirus 3.

[22204] VGAM1589 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22205] An enzyme complex designated DICER COMPLEX, dices the VGAM1589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1589 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1589 RNA is designated SEQ ID:4300, and is provided hereinbelow with reference to the sequence listing part.

[22206] VGAM1589 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1589 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1589 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22207] VGAM1589 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1589 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1589 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1589 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1589 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22208] The complementary binding of VGAM1589 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1589 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1589 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1589 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22209] It is appreciated that VGAM1589 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1589 host target genes. The mRNA of each one of this plurality of VGAM1589 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1589 RNA, herein designated VGAM RNA, and which when bound by VGAM1589 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1589 host target proteins.

[22210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1589 gene, herein designated VGAM GENE, on one or more VGAM1589 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22211] It is yet further appreciated that a function of VGAM1589 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1589 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1589 correlate with, and may be deduced from, the identity of the host target genes which VGAM1589 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22212] Nucleotide sequences of the VGAM1589 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1589 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1589 are further described hereinbelow with reference to Table 1.

[22213] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1589 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22214] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1590 (VGAM1590) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22215] VGAM1590 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1590 was detected is described hereinabove with reference to Figs. 2-8.

[22216] VGAM1590 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM1590 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22217] VGAM1590 gene, herein designated VGAM GENE, encodes

a VGAM1590 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1590 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1590 precursor RNA is designated SEQ ID:1576, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1576 is located at position 91163 relative to the genome of Ateline herpesvirus 3.

[22218] VGAM1590 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22219] An enzyme complex designated DICER COMPLEX, dices the VGAM1590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1590 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1590 RNA is designated SEQ ID:4301, and is provided hereinbelow with reference to the sequence listing part.

[22220] VGAM1590 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1590 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1590 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22221] VGAM1590 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1590 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1590 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1590 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1590 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22222] The complementary binding of VGAM1590 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1590 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1590 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1590 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22223] It is appreciated that VGAM1590 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1590 host target genes. The mRNA of each one of this plurality of VGAM1590 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1590 RNA, herein designated VGAM RNA, and which when bound by VGAM1590 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1590 host target proteins.

[22224] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1590 gene, herein designated VGAM GENE, on one or more VGAM1590 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22225] It is yet further appreciated that a function of VGAM1590 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1590 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1590 correlate with, and may be deduced from, the identity of the host target genes which VGAM1590 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22226] Nucleotide sequences of the VGAM1590 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1590 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1590 are further

described hereinbelow with reference to Table 1.

[22227] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1590 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22228] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1591 (VGAM1591) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22229] VGAM1591 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1591 was detected is described hereinabove with reference to Figs. 2-8.

[22230] VGAM1591 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM1591 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22231] VGAM1591 gene, herein designated VGAM GENE, encodes a VGAM1591 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1591 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1591 precursor RNA is designated SEQ ID:1577, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1577 is located at position 90226 relative to the genome of Ateline herpesvirus 3.

[22232] VGAM1591 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22233] An enzyme complex designated DICER COMPLEX, dices the VGAM1591 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1591 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1591 RNA is designated SEQ ID:4302, and is provided hereinbelow with reference to the sequence listing part.

[22234] VGAM1591 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1591 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1591 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22235] VGAM1591 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1591 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1591 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1591 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22236] The complementary binding of VGAM1591 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1591 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1591

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1591 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22237] It is appreciated that VGAM1591 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1591 host target genes. The mRNA of each one of this plurality of VGAM1591 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1591 RNA, herein designated VGAM RNA, and which when bound by VGAM1591 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1591 host target proteins.

[22238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1591 gene, herein designated VGAM GENE, on one or more VGAM1591 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22239] It is yet further appreciated that a function of VGAM1591 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1591 correlate with, and may be deduced from, the identity of the host target genes which VGAM1591 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22240] Nucleotide sequences of the VGAM1591 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1591 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1591 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1591 are further described hereinbelow with reference to Table 1.

[22241] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1591 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22242] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1592 (VGAM1592) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22243] VGAM1592 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1592 was detected is described hereinabove with reference to Figs. 2-8.

[22244] VGAM1592 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM1592 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[22245] VGAM1592 gene, herein designated VGAM GENE, encodes a VGAM1592 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1592 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1592 precursor RNA is designated SEQ ID:1578, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1578 is located at position 89710 relative to the genome of Ateline herpesvirus 3.

[22246] VGAM1592 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22247] An enzyme complex designated DICER COMPLEX, dices

the VGAM1592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1592 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1592 RNA is designated SEQ ID:4303, and is provided hereinbelow with reference to the sequence listing part.

[22248] VGAM1592 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1592 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1592 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22249] VGAM1592 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1592 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1592 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1592 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1592 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22250] The complementary binding of VGAM1592 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1592 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1592 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1592 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22251] It is appreciated that VGAM1592 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1592 host target genes. The mRNA of each one of this plurality of VGAM1592 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1592 RNA, herein designated VGAM RNA, and which when bound by VGAM1592 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1592 host target proteins.

[22252] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1592 gene, herein designated VGAM GENE, on one or more VGAM1592 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22253] It is yet further appreciated that a function of VGAM1592 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1592 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1592 correlate with, and may be deduced from, the identity of the host target genes which VGAM1592 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22254] Nucleotide sequences of the VGAM1592 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1592 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1592 are further described hereinbelow with reference to Table 1.

[22255] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1592 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22256] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1593 (VGAM1593) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22257] VGAM1593 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1593 was detected is described hereinabove with reference to Figs. 2-8.

[22258] VGAM1593 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM1593 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[22259] VGAM1593 gene, herein designated VGAM GENE, encodes a VGAM1593 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1593 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1593 precursor RNA is designated SEQ ID:1579, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1579 is located at position 86183 relative to the genome of Ateline herpesvirus 3.

[22260] VGAM1593 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22261] An enzyme complex designated DICER COMPLEX, dices the VGAM1593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1593 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1593 RNA is designated SEQ ID:4304, and is provided hereinbelow with reference to the sequence listing part.

[22262] VGAM1593 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1593 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1593 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22263] VGAM1593 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1593 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1593 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1593 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22264] The complementary binding of VGAM1593 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1593 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1593 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1593 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22265] It is appreciated that VGAM1593 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1593 host target genes. The mRNA of each one of this plurality of VGAM1593 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1593 RNA, herein designated VGAM RNA, and which when bound by VGAM1593 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1593 host target proteins.

[22266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1593 gene, herein designated VGAM GENE, on one or more VGAM1593 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22267] It is yet further appreciated that a function of VGAM1593 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1593 correlate with, and may be deduced from, the identity of the host target genes which VGAM1593 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22268] Nucleotide sequences of the VGAM1593 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1593 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1593 are further described hereinbelow with reference to Table 1.

[22269] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1593 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22270] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1594 (VGAM1594) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22271] VGAM1594 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1594 was detected is described hereinabove with reference to Figs. 2-8.

[22272] VGAM1594 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leek yellow stripe po-

tyvirus. VGAM1594 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22273] VGAM1594 gene, herein designated VGAM GENE, encodes a VGAM1594 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1594 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1594 precursor RNA is designated SEQ ID:1580, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1580 is located at position 10003 relative to the genome of Leek yellow stripe potyvirus.

[22274] VGAM1594 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22275] An enzyme complex designated DICER COMPLEX, dices the VGAM1594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1594 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1594 RNA is designated SEQ ID:4305, and is provided hereinbelow with reference to the sequence listing part.

[22276] VGAM1594 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1594 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1594 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22277] VGAM1594 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1594 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1594 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1594 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1594 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22278] The complementary binding of VGAM1594 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1594 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1594 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1594 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22279] It is appreciated that VGAM1594 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1594 host target genes. The mRNA of each one of this plurality of VGAM1594 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1594 RNA, herein designated VGAM RNA, and which when bound by VGAM1594 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1594 host target proteins.

[22280] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1594 gene, herein designated VGAM GENE, on one or more VGAM1594 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22281] It is yet further appreciated that a function of VGAM1594 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1594 include diagnosis, prevention and treatment of viral infection by Leek yellow stripe potyvirus. Specific functions, and accordingly utilities, of VGAM1594 correlate with, and may be deduced from, the identity of the host target genes which VGAM1594 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22282] Nucleotide sequences of the VGAM1594 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1594 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1594 are further described hereinbelow with reference to Table 1.

[22283] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1594 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22284] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1595 (VGAM1595) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22285] VGAM1595 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1595 was detected is described hereinabove with reference to Figs. 2-8.

[22286] VGAM1595 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leek yellow stripe potyvirus. VGAM1595 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22287] VGAM1595 gene, herein designated VGAM GENE, encodes a VGAM1595 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1595 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1595 precursor RNA is designated SEQ ID:1581, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1581 is located at position 6252 relative to the genome of Leek yellow stripe potyvirus.

[22288] VGAM1595 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22289] An enzyme complex designated DICER COMPLEX, dices the VGAM1595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1595 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1595 RNA is designated SEQ ID:4306, and is provided hereinbelow with reference to the sequence listing part.

[22290] VGAM1595 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1595 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1595 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[22291] VGAM1595 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1595 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1595 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1595 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1595 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22292] The complementary binding of VGAM1595 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1595 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1595 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1595 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22293] It is appreciated that VGAM1595 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1595 host target genes. The mRNA of each one of this plurality of VGAM1595 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1595 RNA, herein designated VGAM RNA, and which when bound by VGAM1595 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1595 host target proteins.

[22294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1595 gene, herein designated VGAM GENE, on one

or more VGAM1595 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22295] It is yet further appreciated that a function of VGAM1595 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1595 include diagnosis, prevention and treatment of viral infection by Leek yellow stripe potyvirus. Specific functions, and accordingly utilities, of VGAM1595 correlate with, and may be deduced from, the identity of the host target genes which VGAM1595 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22296] Nucleotide sequences of the VGAM1595 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1595 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1595 are further described hereinbelow with reference to Table 1.

[22297] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1595 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22298] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1596 (VGAM1596) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22299] VGAM1596 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1596 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[22300] VGAM1596 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leek yellow stripe potyvirus. VGAM1596 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22301] VGAM1596 gene, herein designated VGAM GENE, encodes a VGAM1596 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1596 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1596 precursor RNA is designated SEQ ID:1582, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1582 is located at position 3823 relative to the genome of Leek yellow stripe potyvirus.

[22302] VGAM1596 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22303] An enzyme complex designated DICER COMPLEX, dices the VGAM1596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1596 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1596 RNA is designated SEQ ID:4307, and is provided hereinbelow with reference to the sequence listing part.

[22304] VGAM1596 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1596 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1596 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22305] VGAM1596 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1596 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1596 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1596 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1596 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[22306] The complementary binding of VGAM1596 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1596 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1596 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1596 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22307] It is appreciated that VGAM1596 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1596 host target genes. The mRNA of each one of this plurality of VGAM1596 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1596 RNA, herein designated VGAM RNA, and which when bound by VGAM1596 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1596 host target proteins.

[22308] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1596 gene, herein designated VGAM GENE, on one or more VGAM1596 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22309] It is yet further appreciated that a function of VGAM1596 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1596 include diagnosis, prevention and treatment of viral infection by Leek yellow stripe potyvirus. Specific functions, and accordingly utilities, of VGAM1596 correlate with, and may be deduced from, the identity of the host target genes which VGAM1596 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[22310] Nucleotide sequences of the VGAM1596 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1596 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1596 are further described hereinbelow with reference to Table 1.

[22311] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1596 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22312] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1597 (VGAM1597) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22313] VGAM1597 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1597 was detected is described hereinabove with reference to Figs. 2-8.

[22314] VGAM1597 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leek yellow stripe potyvirus. VGAM1597 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22315] VGAM1597 gene, herein designated VGAM GENE, encodes a VGAM1597 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1597 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1597 precursor RNA is designated SEQ ID:1583, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1583 is located at position 5446 relative to the genome of Leek yellow stripe potyvirus.

[22316] VGAM1597 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22317] An enzyme complex designated DICER COMPLEX, dices the VGAM1597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1597 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1597 RNA is designated SEQ ID:4308, and is provided hereinbelow with reference to the sequence listing part.

[22318] VGAM1597 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1597 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1597 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22319] VGAM1597 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1597 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1597 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1597 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1597 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22320] The complementary binding of VGAM1597 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1597 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1597 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1597 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22321] It is appreciated that VGAM1597 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1597 host target genes. The mRNA of each one of this plurality of VGAM1597 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1597 RNA, herein designated VGAM RNA, and which when bound by VGAM1597 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1597 host target proteins.

[22322] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1597 gene, herein designated VGAM GENE, on one or more VGAM1597 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22323] It is yet further appreciated that a function of VGAM1597 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1597 include diagnosis, prevention and treatment of viral infection by Leek yellow stripe potyvirus. Specific functions, and accordingly utilities, of VGAM1597 correlate with, and may be deduced from, the identity of the host target genes which VGAM1597 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22324] Nucleotide sequences of the VGAM1597 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1597 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1597 are further described hereinbelow with reference to Table 1.

[22325] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1597 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22326] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1598 (VGAM1598) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22327] VGAM1598 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1598 was detected is described hereinabove with reference to Figs. 2-8.

[22328] VGAM1598 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus E. VGAM1598 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22329] VGAM1598 gene, herein designated VGAM GENE, encodes a VGAM1598 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1598 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1598 precursor RNA is designated SEQ ID:1584, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1584 is located at position 32869 relative to the genome of Human adenovirus E.

[22330] VGAM1598 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22331] An enzyme complex designated DICER COMPLEX, dices the VGAM1598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1598 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1598 RNA is designated SEQ ID:4309, and is provided hereinbelow with reference to the sequence listing part.

[22332] VGAM1598 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1598 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1598 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22333] VGAM1598 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1598 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1598 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1598 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1598 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22334] The complementary binding of VGAM1598 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1598 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1598 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1598 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22335] It is appreciated that VGAM1598 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1598 host target genes. The mRNA of each one of this plurality of VGAM1598 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1598 RNA, herein designated VGAM RNA, and which when bound by VGAM1598 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1598 host target proteins.

[22336] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1598 gene, herein designated VGAM GENE, on one or more VGAM1598 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22337] It is yet further appreciated that a function of VGAM1598 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1598 include diagnosis, prevention and treatment of viral infection by Human adenovirus E. Specific functions, and accordingly utilities, of VGAM1598 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1598 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22338] Nucleotide sequences of the VGAM1598 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1598 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1598 are further described hereinbelow with reference to Table 1.

[22339] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1598 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22340] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1599 (VGAM1599) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22341] VGAM1599 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1599 was detected is described hereinabove with reference to Figs. 2-8.

[22342] VGAM1599 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus E. VGAM1599 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22343] VGAM1599 gene, herein designated VGAM GENE, encodes a VGAM1599 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1599 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1599 precursor RNA is designated SEQ ID:1585, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1585 is located at position 24788 relative to the genome of Human adenovirus E.

[22344] VGAM1599 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1599 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22345] An enzyme complex designated DICER COMPLEX, dices the VGAM1599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1599 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1599 RNA is designated SEQ ID:4310, and is provided hereinbelow with reference to the sequence listing part.

[22346] VGAM1599 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1599 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1599 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22347] VGAM1599 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1599 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1599 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1599 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22348] The complementary binding of VGAM1599 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1599 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1599 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1599 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22349] It is appreciated that VGAM1599 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1599 host target genes. The mRNA of each one of this plurality of VGAM1599 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1599 RNA, herein designated VGAM RNA, and which when bound by VGAM1599 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1599 host target proteins.

[22350] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1599 gene, herein designated VGAM GENE, on one or more VGAM1599 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22351] It is yet further appreciated that a function of VGAM1599 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of viral infection by Human adenovirus E. Specific functions, and accordingly utilities, of VGAM1599

correlate with, and may be deduced from, the identity of the host target genes which VGAM1599 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22352] Nucleotide sequences of the VGAM1599 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1599 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1599 are further described hereinbelow with reference to Table 1.

[22353] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1599 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22354] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1600 (VGAM1600) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[22355] VGAM1600 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1600 was detected is described hereinabove with reference to Figs. 2-8.

[22356] VGAM1600 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus E. VGAM1600 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22357] VGAM1600 gene, herein designated VGAM GENE, encodes a VGAM1600 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1600 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1600 precursor RNA is designated SEQ ID:1586, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1586 is located at position 23495 relative to the genome of Human adenovirus E.

[22358] VGAM1600 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1600 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22359] An enzyme complex designated DICER COMPLEX, dices the VGAM1600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1600 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1600 RNA is designated SEQ ID:4311, and is provided hereinbelow with reference to the sequence listing part.

[22360] VGAM1600 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1600 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1600 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22361] VGAM1600 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1600 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1600 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1600 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22362] The complementary binding of VGAM1600 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1600 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1600 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1600 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22363] It is appreciated that VGAM1600 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1600 host target genes. The mRNA of each one of this plurality of VGAM1600 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1600 RNA, herein designated VGAM RNA, and which when bound by VGAM1600 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1600 host target proteins.

[22364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1600 gene, herein designated VGAM GENE, on one or more VGAM1600 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22365] It is yet further appreciated that a function of VGAM1600 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of viral infection by Human adenovirus E. Spe-

cific functions, and accordingly utilities, of VGAM1600 correlate with, and may be deduced from, the identity of the host target genes which VGAM1600 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22366] Nucleotide sequences of the VGAM1600 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1600 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1600 are further described hereinbelow with reference to Table 1.

[22367] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1600 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22368] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1601 (VGAM1601) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[22369] VGAM1601 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1601 was detected is described hereinabove with reference to Figs. 2-8.

[22370] VGAM1601 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus E. VGAM1601 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22371] VGAM1601 gene, herein designated VGAM GENE, encodes a VGAM1601 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1601 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1601 precursor RNA is designated SEQ ID:1587, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1587 is located at position 32517 relative to the genome of Human adenovirus E.

[22372] VGAM1601 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22373] An enzyme complex designated DICER COMPLEX, dices the VGAM1601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1601 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1601 RNA is designated SEQ ID:4312, and is provided hereinbelow with reference to the sequence listing part.

[22374] VGAM1601 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1601 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1601 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22375] VGAM1601 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1601 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1601 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1601 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22376] The complementary binding of VGAM1601 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1601 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1601 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1601 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22377] It is appreciated that VGAM1601 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1601 host target genes. The mRNA of each one of this plurality of VGAM1601 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1601 RNA, herein designated VGAM RNA, and which when bound by VGAM1601 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1601 host target proteins.

[22378] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1601 gene, herein designated VGAM GENE, on one or more VGAM1601 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22379] It is yet further appreciated that a function of VGAM1601 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1601 include diagnosis, prevention and

treatment of viral infection by Human adenovirus E. Specific functions, and accordingly utilities, of VGAM1601 correlate with, and may be deduced from, the identity of the host target genes which VGAM1601 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22380] Nucleotide sequences of the VGAM1601 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1601 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1601 are further described hereinbelow with reference to Table 1.

[22381] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1601 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22382] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1602 (VGAM1602) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22383] VGAM1602 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1602 was detected is described hereinabove with reference to Figs. 2-8.

[22384] VGAM1602 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus E. VGAM1602 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22385] VGAM1602 gene, herein designated VGAM GENE, encodes a VGAM1602 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1602 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1602 precursor RNA is designated SEQ ID:1588, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1588 is located at position 27497 relative to the genome of Human adenovirus E.

[22386] VGAM1602 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22387] An enzyme complex designated DICER COMPLEX, dices the VGAM1602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1602 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1602 RNA is designated SEQ ID:4313, and is provided hereinbelow with reference to the sequence listing part.

[22388] VGAM1602 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1602 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1602 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22389] VGAM1602 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1602 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1602 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1602 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1602 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22390] The complementary binding of VGAM1602 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1602 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1602 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1602 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22391] It is appreciated that VGAM1602 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1602 host target genes. The mRNA of each one of this plurality of VGAM1602 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1602 RNA, herein designated VGAM

RNA, and which when bound by VGAM1602 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1602 host target proteins.

[22392] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1602 gene, herein designated VGAM GENE, on one or more VGAM1602 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22393] It is yet further appreciated that a function of VGAM1602 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1602 include diagnosis, prevention and treatment of viral infection by Human adenovirus E. Specific functions, and accordingly utilities, of VGAM1602 correlate with, and may be deduced from, the identity of the host target genes which VGAM1602 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22394] Nucleotide sequences of the VGAM1602 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1602 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1602 are further described hereinbelow with reference to Table 1.

[22395] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1602 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22396] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1603 (VGAM1603) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22397] VGAM1603 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1603 was detected is described hereinabove with reference to Figs. 2-8.

[22398] VGAM1603 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM1603 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22399] VGAM1603 gene, herein designated VGAM GENE, encodes a VGAM1603 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1603 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1603 precursor RNA is designated SEQ ID:1589, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1589 is located at position 4189

relative to the genome of Taura syndrome virus.

[22400] VGAM1603 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22401] An enzyme complex designated DICER COMPLEX, dices the VGAM1603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1603 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1603 RNA is designated SEQ ID:4314, and is provided hereinbelow with reference to the sequence listing part.

[22402] VGAM1603 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1603 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1603 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22403] VGAM1603 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1603 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1603 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1603 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1603 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22404] The complementary binding of VGAM1603 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1603 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1603 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1603 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22405] It is appreciated that VGAM1603 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1603 host target genes. The mRNA of each one of this plurality of VGAM1603 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1603 RNA, herein designated VGAM RNA, and which when bound by VGAM1603 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1603 host target proteins.

[22406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1603 gene, herein designated VGAM GENE, on one or more VGAM1603 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22407] It is yet further appreciated that a function of VGAM1603 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1603 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM1603 correlate with, and may be deduced from, the identity of the host target genes which VGAM1603 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22408] Nucleotide sequences of the VGAM1603 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1603 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1603 are further described hereinbelow with reference to Table 1.

[22409] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1603 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22410] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1604 (VGAM1604) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22411] VGAM1604 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1604 was detected is described hereinabove with reference to Figs. 2-8.

[22412] VGAM1604 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM1604 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22413] VGAM1604 gene, herein designated VGAM GENE, encodes a VGAM1604 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1604 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1604 precursor RNA is designated SEQ ID:1590, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1590 is located at position 2524 relative to the genome of Taura syndrome virus.

[22414] VGAM1604 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22415] An enzyme complex designated DICER COMPLEX, dices the VGAM1604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1604 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1604 RNA is designated SEQ ID:4315, and is provided hereinbelow with reference to the sequence

listing part.

[22416] VGAM1604 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1604 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1604 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22417] VGAM1604 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1604 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1604 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1604 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1604 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22418] The complementary binding of VGAM1604 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1604 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1604 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1604 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22419] It is appreciated that VGAM1604 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1604 host target genes. The mRNA of each one of this plurality of VGAM1604 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1604 RNA, herein designated VGAM RNA, and which when bound by VGAM1604 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1604 host target proteins.

[22420] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1604 gene, herein designated VGAM GENE, on one or more VGAM1604 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22421] It is yet further appreciated that a function of VGAM1604

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1604 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM1604 correlate with, and may be deduced from, the identity of the host target genes which VGAM1604 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22422] Nucleotide sequences of the VGAM1604 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1604 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1604 are further described hereinbelow with reference to Table 1.

[22423] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1604 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22424] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1605 (VGAM1605) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22425] VGAM1605 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1605 was detected is described hereinabove with reference to Figs. 2-8.

[22426] VGAM1605 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM1605 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22427] VGAM1605 gene, herein designated VGAM GENE, encodes a VGAM1605 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1605 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1605 precursor RNA is designated SEQ ID:1591, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1591 is located at position 8483 relative to the genome of Taura syndrome virus.

[22428] VGAM1605 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22429] An enzyme complex designated DICER COMPLEX, dices the VGAM1605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1605 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1605 RNA is designated SEQ ID:4316, and

is provided hereinbelow with reference to the sequence listing part.

[22430] VGAM1605 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1605 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1605 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22431] VGAM1605 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1605 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1605 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1605 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22432] The complementary binding of VGAM1605 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1605 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1605 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1605 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22433] It is appreciated that VGAM1605 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1605 host target genes. The mRNA of each one of this plurality of VGAM1605 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1605 RNA, herein designated VGAM RNA, and which when bound by VGAM1605 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1605 host target proteins.

[22434] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1605 gene, herein designated VGAM GENE, on one or more VGAM1605 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22435] It is yet further appreciated that a function of VGAM1605 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM1605 correlate with, and may be deduced from, the identity of the host target genes which VGAM1605 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22436] Nucleotide sequences of the VGAM1605 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1605 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1605 are further described hereinbelow with reference to Table 1.

[22437] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1605 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22438] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1606 (VGAM1606) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22439] VGAM1606 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1606 was detected is described hereinabove with reference to Figs. 2-8.

[22440] VGAM1606 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM1606 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22441] VGAM1606 gene, herein designated VGAM GENE, encodes

a VGAM1606 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1606 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1606 precursor RNA is designated SEQ ID:1592, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1592 is located at position 7811 relative to the genome of Taura syndrome virus.

[22442] VGAM1606 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22443] An enzyme complex designated DICER COMPLEX, dices the VGAM1606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1606 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1606 RNA is designated SEQ ID:4317, and is provided hereinbelow with reference to the sequence listing part.

[22444] VGAM1606 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1606 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1606 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22445] VGAM1606 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1606 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1606 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1606 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1606 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22446] The complementary binding of VGAM1606 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1606 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1606 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1606 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22447] It is appreciated that VGAM1606 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1606 host target genes. The mRNA of each one of this plurality of VGAM1606 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1606 RNA, herein designated VGAM RNA, and which when bound by VGAM1606 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1606 host target proteins.

[22448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1606 gene, herein designated VGAM GENE, on one or more VGAM1606 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22449] It is yet further appreciated that a function of VGAM1606 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1606 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM1606 correlate with, and may be deduced from, the identity of the host target genes which VGAM1606 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22450] Nucleotide sequences of the VGAM1606 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1606 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1606 are further

described hereinbelow with reference to Table 1.

[22451] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1606 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22452] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1607 (VGAM1607) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22453] VGAM1607 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1607 was detected is described hereinabove with reference to Figs. 2-8.

[22454] VGAM1607 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM1607 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22455] VGAM1607 gene, herein designated VGAM GENE, encodes a VGAM1607 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1607 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1607 precursor RNA is designated SEQ ID:1593, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1593 is located at position 567 relative to the genome of Taura syndrome virus.

[22456] VGAM1607 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1607 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22457] An enzyme complex designated DICER COMPLEX, dices the VGAM1607 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1607 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM1607 RNA is designated SEQ ID:4318, and is provided hereinbelow with reference to the sequence listing part.

[22458] VGAM1607 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1607 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1607 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22459] VGAM1607 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1607 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1607 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1607 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1607 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22460] The complementary binding of VGAM1607 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1607 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1607

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1607 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22461] It is appreciated that VGAM1607 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1607 host target genes. The mRNA of each one of this plurality of VGAM1607 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1607 RNA, herein designated VGAM RNA, and which when bound by VGAM1607 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1607 host target proteins.

[22462] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1607 gene, herein designated VGAM GENE, on one or more VGAM1607 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22463] It is yet further appreciated that a function of VGAM1607 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1607 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM1607 correlate with, and may be deduced from, the identity of the host target genes which VGAM1607 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22464] Nucleotide sequences of the VGAM1607 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1607 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1607 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1607 are further described hereinbelow with reference to Table 1.

[22465] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1607 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22466] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1608 (VGAM1608) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22467] VGAM1608 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1608 was detected is described hereinabove with reference to Figs. 2-8.

[22468] VGAM1608 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM1608 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[22469] VGAM1608 gene, herein designated VGAM GENE, encodes a VGAM1608 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1608 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1608 precursor RNA is designated SEQ ID:1594, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1594 is located at position 3052 relative to the genome of Taura syndrome virus.

[22470] VGAM1608 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22471] An enzyme complex designated DICER COMPLEX, dices

the VGAM1608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1608 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1608 RNA is designated SEQ ID:4319, and is provided hereinbelow with reference to the sequence listing part.

[22472] VGAM1608 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1608 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1608 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22473] VGAM1608 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1608 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1608 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1608 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1608 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22474] The complementary binding of VGAM1608 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1608 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1608 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1608 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22475] It is appreciated that VGAM1608 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1608 host target genes. The mRNA of each one of this plurality of VGAM1608 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1608 RNA, herein designated VGAM RNA, and which when bound by VGAM1608 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1608 host target proteins.

[22476] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1608 gene, herein designated VGAM GENE, on one or more VGAM1608 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22477] It is yet further appreciated that a function of VGAM1608 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1608 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM1608 correlate with, and may be deduced from, the identity of the host target genes which VGAM1608 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22478] Nucleotide sequences of the VGAM1608 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1608 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1608 are further described hereinbelow with reference to Table 1.

[22479] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1608 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22480] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1609 (VGAM1609) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22481] VGAM1609 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1609 was detected is described hereinabove with reference to Figs. 2-8.

[22482] VGAM1609 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1609 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22483] VGAM1609 gene, herein designated VGAM GENE, encodes a VGAM1609 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1609 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1609 precursor RNA is designated SEQ ID:1595, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1595 is located at position 8708 relative to the genome of Chimpanzee cytomegalovirus.

[22484] VGAM1609 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22485] An enzyme complex designated DICER COMPLEX, dices the VGAM1609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1609 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1609 RNA is designated SEQ ID:4320, and is provided hereinbelow with reference to the sequence listing part.

[22486] VGAM1609 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1609 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1609 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22487] VGAM1609 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1609 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1609 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1609 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1609 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22488] The complementary binding of VGAM1609 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1609 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1609 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1609 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22489] It is appreciated that VGAM1609 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1609 host target genes. The mRNA of each one of this plurality of VGAM1609 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1609 RNA, herein designated VGAM RNA, and which when bound by VGAM1609 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1609 host target proteins.

[22490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1609 gene, herein designated VGAM GENE, on one or more VGAM1609 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22491] It is yet further appreciated that a function of VGAM1609 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1609 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1609 correlate with, and may be deduced from, the identity of the host target genes which VGAM1609 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22492] Nucleotide sequences of the VGAM1609 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1609 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1609 are further described hereinbelow with reference to Table 1.

[22493] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1609 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22494] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1610 (VGAM1610) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22495] VGAM1610 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1610 was detected is described hereinabove with reference to Figs. 2-8.

[22496] VGAM1610 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cy-

tomegalovirus. VGAM1610 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22497] VGAM1610 gene, herein designated VGAM GENE, encodes a VGAM1610 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1610 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1610 precursor RNA is designated SEQ ID:1596, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1596 is located at position 5615 relative to the genome of Chimpanzee cytomegalovirus.

[22498] VGAM1610 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[22499] An enzyme complex designated DICER COMPLEX, dices the VGAM1610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1610 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1610 RNA is designated SEQ ID:4321, and is provided hereinbelow with reference to the sequence listing part.

[22500] VGAM1610 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1610 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1610 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22501] VGAM1610 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1610 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1610 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1610 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22502] The complementary binding of VGAM1610 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1610 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1610 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1610 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22503] It is appreciated that VGAM1610 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1610 host target genes. The mRNA of each one of this plurality of VGAM1610 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1610 RNA, herein designated VGAM RNA, and which when bound by VGAM1610 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1610 host target proteins.

[22504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1610 gene, herein designated VGAM GENE, on one or more VGAM1610 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22505] It is yet further appreciated that a function of VGAM1610 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1610 correlate with, and may be deduced from, the identity of the host target genes which VGAM1610 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22506] Nucleotide sequences of the VGAM1610 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1610 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1610 are further described hereinbelow with reference to Table 1.

[22507] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1610 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22508] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1611 (VGAM1611) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22509] VGAM1611 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1611 was detected is described hereinabove with reference to Figs. 2-8.

[22510] VGAM1611 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1611 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22511] VGAM1611 gene, herein designated VGAM GENE, encodes a VGAM1611 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1611 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1611 precursor RNA is designated SEQ ID:1597, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1597 is located at position 10114 relative to the genome of Chimpanzee cytomegalovirus.

[22512] VGAM1611 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22513] An enzyme complex designated DICER COMPLEX, dices the VGAM1611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1611 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1611 RNA is designated SEQ ID:4322, and is provided hereinbelow with reference to the sequence listing part.

[22514] VGAM1611 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1611 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1611 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[22515] VGAM1611 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1611 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1611 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1611 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1611 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22516] The complementary binding of VGAM1611 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1611 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1611 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1611 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22517] It is appreciated that VGAM1611 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1611 host target genes. The mRNA of each one of this plurality of VGAM1611 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1611 RNA, herein designated VGAM RNA, and which when bound by VGAM1611 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1611 host target proteins.

[22518] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1611 gene, herein designated VGAM GENE, on one

or more VGAM1611 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22519] It is yet further appreciated that a function of VGAM1611 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1611 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1611 correlate with, and may be deduced from, the identity of the host target genes which VGAM1611 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22520] Nucleotide sequences of the VGAM1611 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1611 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1611 are further described hereinbelow with reference to Table 1.

[22521] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1611 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22522] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1612 (VGAM1612) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22523] VGAM1612 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1612 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[22524] VGAM1612 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1612 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22525] VGAM1612 gene, herein designated VGAM GENE, encodes a VGAM1612 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1612 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1612 precursor RNA is designated SEQ ID:1598, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1598 is located at position 1800 relative to the genome of Chimpanzee cytomegalovirus.

[22526] VGAM1612 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22527] An enzyme complex designated DICER COMPLEX, dices the VGAM1612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1612 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1612 RNA is designated SEQ ID:4323, and is provided hereinbelow with reference to the sequence listing part.

[22528] VGAM1612 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1612 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1612 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22529] VGAM1612 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1612 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1612 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1612 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1612 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[22530] The complementary binding of VGAM1612 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1612 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1612 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1612 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22531] It is appreciated that VGAM1612 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1612 host target genes. The mRNA of each one of this plurality of VGAM1612 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1612 RNA, herein designated VGAM RNA, and which when bound by VGAM1612 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1612 host target proteins.

[22532] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1612 gene, herein designated VGAM GENE, on one or more VGAM1612 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22533] It is yet further appreciated that a function of VGAM1612 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1612 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1612 correlate with, and may be deduced from, the identity of the host target genes which VGAM1612 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[22534] Nucleotide sequences of the VGAM1612 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1612 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1612 are further described hereinbelow with reference to Table 1.

[22535] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1612 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22536] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1613 (VGAM1613) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22537] VGAM1613 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1613 was detected is described hereinabove with reference to Figs. 2-8.

[22538] VGAM1613 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1613 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22539] VGAM1613 gene, herein designated VGAM GENE, encodes a VGAM1613 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1613 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1613 precursor RNA is designated SEQ ID:1599, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1599 is located at position 4267 relative to the genome of Chimpanzee cytomegalovirus.

[22540] VGAM1613 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22541] An enzyme complex designated DICER COMPLEX, dices the VGAM1613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1613 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM1613 RNA is designated SEQ ID:4324, and is provided hereinbelow with reference to the sequence listing part.

[22542] VGAM1613 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1613 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1613 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22543] VGAM1613 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1613 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1613 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1613 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22544] The complementary binding of VGAM1613 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1613 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1613 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1613 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22545] It is appreciated that VGAM1613 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1613 host target genes. The mRNA of each one of this plurality of VGAM1613 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1613 RNA, herein designated VGAM RNA, and which when bound by VGAM1613 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1613 host target proteins.

[22546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1613 gene, herein designated VGAM GENE, on one or more VGAM1613 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22547] It is yet further appreciated that a function of VGAM1613 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1613 correlate with, and may be deduced from, the identity of the host target genes which

VGAM1613 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22548] Nucleotide sequences of the VGAM1613 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1613 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1613 are further described hereinbelow with reference to Table 1.

[22549] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1613 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22550] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1614 (VGAM1614) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22551] VGAM1614 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1614 was detected is described hereinabove with reference to Figs. 2-8.

[22552] VGAM1614 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1614 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22553] VGAM1614 gene, herein designated VGAM GENE, encodes a VGAM1614 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1614 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1614 precursor RNA is designated SEQ ID:1600, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1600 is located at position 6443 relative to the genome of Chimpanzee cytomegalovirus.

[22554] VGAM1614 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22555] An enzyme complex designated DICER COMPLEX, dices the VGAM1614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1614 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1614 RNA is designated SEQ ID:4325, and is provided hereinbelow with reference to the sequence listing part.

[22556] VGAM1614 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1614 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1614 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22557] VGAM1614 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1614 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1614 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1614 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1614 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22558] The complementary binding of VGAM1614 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1614 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1614 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1614 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22559] It is appreciated that VGAM1614 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1614 host target genes. The mRNA of each one of this plurality of VGAM1614 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1614 RNA, herein designated VGAM RNA, and which when bound by VGAM1614 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1614 host target proteins.

[22560] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1614 gene, herein designated VGAM GENE, on one or more VGAM1614 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22561] It is yet further appreciated that a function of VGAM1614 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1614 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1614 correlate with, and may be deduced

from, the identity of the host target genes which VGAM1614 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22562] Nucleotide sequences of the VGAM1614 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1614 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1614 are further described hereinbelow with reference to Table 1.

[22563] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1614 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22564] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1615 (VGAM1615) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22565] VGAM1615 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1615 was detected is described hereinabove with reference to Figs. 2-8.

[22566] VGAM1615 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1615 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22567] VGAM1615 gene, herein designated VGAM GENE, encodes a VGAM1615 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1615 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1615 precursor RNA is designated SEQ ID:1601, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1601 is located at position 1492 relative to the genome of Chimpanzee cytomegalovirus.

[22568] VGAM1615 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1615 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22569] An enzyme complex designated DICER COMPLEX, dices the VGAM1615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1615 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1615 RNA is designated SEQ ID:4326, and is provided hereinbelow with reference to the sequence listing part.

[22570] VGAM1615 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1615 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1615 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22571] VGAM1615 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1615 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1615 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1615 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22572] The complementary binding of VGAM1615 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1615 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1615 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1615 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22573] It is appreciated that VGAM1615 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1615 host target genes. The mRNA of each one of this plurality of VGAM1615 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1615 RNA, herein designated VGAM RNA, and which when bound by VGAM1615 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1615 host target proteins.

[22574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1615 gene, herein designated VGAM GENE, on one or more VGAM1615 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22575] It is yet further appreciated that a function of VGAM1615 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utili-

ties, of VGAM1615 correlate with, and may be deduced from, the identity of the host target genes which VGAM1615 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22576] Nucleotide sequences of the VGAM1615 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1615 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1615 are further described hereinbelow with reference to Table 1.

[22577] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1615 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22578] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1616 (VGAM1616) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[22579] VGAM1616 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1616 was detected is described hereinabove with reference to Figs. 2-8.

[22580] VGAM1616 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1616 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22581] VGAM1616 gene, herein designated VGAM GENE, encodes a VGAM1616 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1616 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1616 precursor RNA is designated SEQ ID:1602, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1602 is located at position 2891 relative to the genome of Chimpanzee cytomegalovirus.

[22582] VGAM1616 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1616 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22583] An enzyme complex designated DICER COMPLEX, dices the VGAM1616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1616 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1616 RNA is designated SEQ ID:4327, and is provided hereinbelow with reference to the sequence listing part.

[22584] VGAM1616 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1616 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1616 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22585] VGAM1616 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1616 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1616 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1616 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1616 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22586] The complementary binding of VGAM1616 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1616 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1616 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1616 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22587] It is appreciated that VGAM1616 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1616 host target genes. The mRNA of each one of this plurality of VGAM1616 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1616 RNA, herein designated VGAM RNA, and which when bound by VGAM1616 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1616 host target proteins.

[22588] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1616 gene, herein designated VGAM GENE, on one or more VGAM1616 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22589] It is yet further appreciated that a function of VGAM1616 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of viral infection by Chimpanzee cy-

tomegalovirus. Specific functions, and accordingly utilities, of VGAM1616 correlate with, and may be deduced from, the identity of the host target genes which VGAM1616 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22590] Nucleotide sequences of the VGAM1616 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1616 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1616 are further described hereinbelow with reference to Table 1.

[22591] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1616 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22592] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1617 (VGAM1617) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[22593] VGAM1617 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1617 was detected is described hereinabove with reference to Figs. 2-8.

[22594] VGAM1617 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM1617 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22595] VGAM1617 gene, herein designated VGAM GENE, encodes a VGAM1617 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1617 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1617 precursor RNA is designated SEQ ID:1603, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1603 is located at position 10492 relative to the genome of Fowl adenovirus D.

[22596] VGAM1617 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22597] An enzyme complex designated DICER COMPLEX, dices the VGAM1617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1617 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1617 RNA is designated SEQ ID:4328, and is provided hereinbelow with reference to the sequence listing part.

[22598] VGAM1617 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1617 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1617 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22599] VGAM1617 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1617 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1617 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1617 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1617 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22600] The complementary binding of VGAM1617 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1617 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1617 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1617 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22601] It is appreciated that VGAM1617 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1617 host target genes. The mRNA of each one of this plurality of VGAM1617 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1617 RNA, herein designated VGAM RNA, and which when bound by VGAM1617 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1617 host target proteins.

[22602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1617 gene, herein designated VGAM GENE, on one or more VGAM1617 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22603] It is yet further appreciated that a function of VGAM1617 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1617 include diagnosis, prevention and

treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM1617 correlate with, and may be deduced from, the identity of the host target genes which VGAM1617 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22604] Nucleotide sequences of the VGAM1617 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1617 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1617 are further described hereinbelow with reference to Table 1.

[22605] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1617 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22606] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1618 (VGAM1618) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22607] VGAM1618 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1618 was detected is described hereinabove with reference to Figs. 2-8.

[22608] VGAM1618 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM1618 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22609] VGAM1618 gene, herein designated VGAM GENE, encodes a VGAM1618 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1618 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1618 precursor RNA is designated SEQ ID:1604, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1604 is located at position 5025 relative to the genome of Fowl adenovirus D.

[22610] VGAM1618 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22611] An enzyme complex designated DICER COMPLEX, dices the VGAM1618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1618 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1618 RNA is designated SEQ ID:4329, and is provided hereinbelow with reference to the sequence listing part.

[22612] VGAM1618 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1618 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1618 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22613] VGAM1618 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1618 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1618 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1618 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1618 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22614] The complementary binding of VGAM1618 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1618 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1618 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1618 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22615] It is appreciated that VGAM1618 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1618 host target genes. The mRNA of each one of this plurality of VGAM1618 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1618 RNA, herein designated VGAM

RNA, and which when bound by VGAM1618 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1618 host target proteins.

[22616] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1618 gene, herein designated VGAM GENE, on one or more VGAM1618 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22617] It is yet further appreciated that a function of VGAM1618 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1618 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM1618 correlate with, and may be deduced from, the identity of the host target genes which VGAM1618 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22618] Nucleotide sequences of the VGAM1618 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1618 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1618 are further described hereinbelow with reference to Table 1.

[22619] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1618 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22620] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1619 (VGAM1619) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22621] VGAM1619 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1619 was detected is described hereinabove with reference to Figs. 2-8.

[22622] VGAM1619 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM1619 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22623] VGAM1619 gene, herein designated VGAM GENE, encodes a VGAM1619 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1619 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1619 precursor RNA is designated SEQ ID:1605, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1605 is located at position 4810

relative to the genome of Fowl adenovirus D.

[22624] VGAM1619 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22625] An enzyme complex designated DICER COMPLEX, dices the VGAM1619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1619 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1619 RNA is designated SEQ ID:4330, and is provided hereinbelow with reference to the sequence listing part.

[22626] VGAM1619 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1619 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1619 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22627] VGAM1619 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1619 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1619 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1619 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1619 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22628] The complementary binding of VGAM1619 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1619 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1619 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1619 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22629] It is appreciated that VGAM1619 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1619 host target genes. The mRNA of each one of this plurality of VGAM1619 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1619 RNA, herein designated VGAM RNA, and which when bound by VGAM1619 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1619 host target proteins.

[22630] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1619 gene, herein designated VGAM GENE, on one or more VGAM1619 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22631] It is yet further appreciated that a function of VGAM1619 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1619 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM1619 correlate with, and may be deduced from, the identity of the host target genes which VGAM1619 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22632] Nucleotide sequences of the VGAM1619 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1619 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1619 are further described hereinbelow with reference to Table 1.

[22633] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1619 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22634] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1620 (VGAM1620) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22635] VGAM1620 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1620 was detected is described hereinabove with reference to Figs. 2-8.

[22636] VGAM1620 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM1620 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22637] VGAM1620 gene, herein designated VGAM GENE, encodes a VGAM1620 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1620 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1620 precursor RNA is designated SEQ ID:1606, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1606 is located at position 9503 relative to the genome of Fowl adenovirus D.

[22638] VGAM1620 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22639] An enzyme complex designated DICER COMPLEX, dices the VGAM1620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1620 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1620 RNA is designated SEQ ID:4331, and is provided hereinbelow with reference to the sequence

listing part.

[22640] VGAM1620 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1620 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1620 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22641] VGAM1620 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1620 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1620 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1620 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1620 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22642] The complementary binding of VGAM1620 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1620 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1620 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1620 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22643] It is appreciated that VGAM1620 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1620 host target genes. The mRNA of each one of this plurality of VGAM1620 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1620 RNA, herein designated VGAM RNA, and which when bound by VGAM1620 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1620 host target proteins.

[22644] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1620 gene, herein designated VGAM GENE, on one or more VGAM1620 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22645] It is yet further appreciated that a function of VGAM1620

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1620 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM1620 correlate with, and may be deduced from, the identity of the host target genes which VGAM1620 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22646] Nucleotide sequences of the VGAM1620 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1620 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1620 are further described hereinbelow with reference to Table 1.

[22647] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1620 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22648] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1621 (VGAM1621) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22649] VGAM1621 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1621 was detected is described hereinabove with reference to Figs. 2-8.

[22650] VGAM1621 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM1621 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22651] VGAM1621 gene, herein designated VGAM GENE, encodes a VGAM1621 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1621 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1621 precursor RNA is designated SEQ ID:1607, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1607 is located at position 4619 relative to the genome of Fowl adenovirus D.

[22652] VGAM1621 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22653] An enzyme complex designated DICER COMPLEX, dices the VGAM1621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1621 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1621 RNA is designated SEQ ID:4332, and

is provided hereinbelow with reference to the sequence listing part.

[22654] VGAM1621 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1621 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1621 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22655] VGAM1621 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1621 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1621 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1621 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22656] The complementary binding of VGAM1621 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1621 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1621 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1621 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22657] It is appreciated that VGAM1621 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1621 host target genes. The mRNA of each one of this plurality of VGAM1621 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1621 RNA, herein designated VGAM RNA, and which when bound by VGAM1621 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1621 host target proteins.

[22658] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1621 gene, herein designated VGAM GENE, on one or more VGAM1621 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22659] It is yet further appreciated that a function of VGAM1621 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM1621 correlate with, and may be deduced from, the identity of the host target genes which VGAM1621 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22660] Nucleotide sequences of the VGAM1621 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1621 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1621 are further described hereinbelow with reference to Table 1.

[22661] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1621 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22662] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1622 (VGAM1622) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22663] VGAM1622 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1622 was detected is described hereinabove with reference to Figs. 2-8.

[22664] VGAM1622 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1622 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22665] VGAM1622 gene, herein designated VGAM GENE, encodes a VGAM1622 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1622 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1622 precur-

sor RNA is designated SEQ ID:1608, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1608 is located at position 87319 relative to the genome of Bovine herpesvirus 4.

[22666] VGAM1622 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22667] An enzyme complex designated DICER COMPLEX, dices the VGAM1622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1622 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM1622 RNA is designated SEQ ID:4333, and is provided hereinbelow with reference to the sequence listing part.

[22668] VGAM1622 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1622 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1622 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22669] VGAM1622 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1622 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1622 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1622 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1622 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22670] The complementary binding of VGAM1622 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1622 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1622 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1622 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22671] It is appreciated that VGAM1622 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1622 host target genes. The mRNA of

each one of this plurality of VGAM1622 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1622 RNA, herein designated VGAM RNA, and which when bound by VGAM1622 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1622 host target proteins.

[22672] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1622 gene, herein designated VGAM GENE, on one or more VGAM1622 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[22673] It is yet further appreciated that a function of VGAM1622 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1622 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1622 correlate with, and may be deduced from, the identity of the host target genes which VGAM1622 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22674] Nucleotide sequences of the VGAM1622 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1622 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1622 are further described hereinbelow with reference to Table 1.

[22675] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1622 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[22676] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1623 (VGAM1623) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22677] VGAM1623 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1623 was detected is described hereinabove with reference to Figs. 2-8.

[22678] VGAM1623 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1623 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22679] VGAM1623 gene, herein designated VGAM GENE, encodes a VGAM1623 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1623 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1623 precursor RNA is designated SEQ ID:1609, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1609 is located at position 83968 relative to the genome of Bovine herpesvirus 4.

[22680] VGAM1623 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22681] An enzyme complex designated DICER COMPLEX, dices the VGAM1623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1623 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1623 RNA is designated SEQ ID:4334, and is provided hereinbelow with reference to the sequence listing part.

[22682] VGAM1623 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1623 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1623 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22683] VGAM1623 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1623 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1623 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1623 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1623 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22684] The complementary binding of VGAM1623 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1623 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1623 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1623 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22685] It is appreciated that VGAM1623 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1623 host target genes. The mRNA of each one of this plurality of VGAM1623 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1623 RNA, herein designated VGAM RNA, and which when bound by VGAM1623 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1623 host target proteins.

[22686] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1623 gene, herein designated VGAM GENE, on one or more VGAM1623 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22687] It is yet further appreciated that a function of VGAM1623 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1623 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1623 correlate with, and may be deduced from, the identity of the host target genes which VGAM1623 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22688] Nucleotide sequences of the VGAM1623 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1623 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1623 are further described hereinbelow with reference to Table 1.

[22689] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1623 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22690] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1624 (VGAM1624) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22691] VGAM1624 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1624 was detected is described hereinabove with reference to Figs. 2-8.

[22692] VGAM1624 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1624 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22693] VGAM1624 gene, herein designated VGAM GENE, encodes a VGAM1624 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1624 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1624 precursor RNA is designated SEQ ID:1610, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1610 is located at position 86638 relative to the genome of Bovine herpesvirus 4.

[22694] VGAM1624 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22695] An enzyme complex designated DICER COMPLEX, dices the VGAM1624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1624 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1624 RNA is designated SEQ ID:4335, and is provided hereinbelow with reference to the sequence listing part.

[22696] VGAM1624 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1624 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1624 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22697] VGAM1624 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1624 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1624 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1624 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1624 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22698] The complementary binding of VGAM1624 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1624 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1624 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1624 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22699] It is appreciated that VGAM1624 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1624 host target genes. The mRNA of each one of this plurality of VGAM1624 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1624 RNA, herein designated VGAM RNA, and which when bound by VGAM1624 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1624 host target proteins.

[22700] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1624 gene, herein designated VGAM GENE, on one or more VGAM1624 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22701] It is yet further appreciated that a function of VGAM1624 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1624 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1624 correlate with, and may be deduced from, the identity of the host target genes which VGAM1624 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22702] Nucleotide sequences of the VGAM1624 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1624 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1624 are further described hereinbelow with reference to Table 1.

[22703] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1624 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22704] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1625 (VGAM1625) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22705] VGAM1625 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1625 was detected is described hereinabove with reference to Figs. 2-8.

[22706] VGAM1625 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1625 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22707] VGAM1625 gene, herein designated VGAM GENE, encodes a VGAM1625 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1625 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1625 precursor RNA is designated SEQ ID:1611, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1611 is located at position 86511 relative to the genome of Bovine herpesvirus 4.

[22708] VGAM1625 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22709] An enzyme complex designated DICER COMPLEX, dices the VGAM1625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1625 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1625 RNA is designated SEQ ID:4336, and is provided hereinbelow with reference to the sequence listing part.

[22710] VGAM1625 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1625 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1625 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22711] VGAM1625 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1625 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1625 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1625 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1625 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22712] The complementary binding of VGAM1625 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1625 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1625 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1625 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22713] It is appreciated that VGAM1625 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1625 host target genes. The mRNA of each one of this plurality of VGAM1625 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1625 RNA, herein designated VGAM RNA, and which when bound by VGAM1625 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1625 host target proteins.

[22714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1625 gene, herein designated VGAM GENE, on one or more VGAM1625 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22715] It is yet further appreciated that a function of VGAM1625 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1625 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1625 correlate with, and may be deduced from, the identity of the host target genes which VGAM1625 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22716] Nucleotide sequences of the VGAM1625 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1625 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1625 are further described hereinbelow with reference to Table 1.

[22717] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1625 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22718] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1626 (VGAM1626) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22719] VGAM1626 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1626 was detected is described hereinabove with reference to Figs. 2-8.

[22720] VGAM1626 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1626 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22721] VGAM1626 gene, herein designated VGAM GENE, encodes a VGAM1626 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1626 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1626 precursor RNA is designated SEQ ID:1612, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1612 is located at position 80653 relative to the genome of Bovine herpesvirus 4.

[22722] VGAM1626 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22723] An enzyme complex designated DICER COMPLEX, dices the VGAM1626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1626 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1626 RNA is designated SEQ ID:4337, and is provided hereinbelow with reference to the sequence listing part.

[22724] VGAM1626 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1626 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1626 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22725] VGAM1626 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1626 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1626 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1626 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1626 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22726] The complementary binding of VGAM1626 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1626 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1626 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1626 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[22727] It is appreciated that VGAM1626 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1626 host target genes. The mRNA of each one of this plurality of VGAM1626 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1626 RNA, herein designated VGAM RNA, and which when bound by VGAM1626 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1626 host target proteins.

[22728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1626 gene, herein designated VGAM GENE, on one or more VGAM1626 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22729] It is yet further appreciated that a function of VGAM1626 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1626 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1626 correlate with, and may be deduced from, the identity of the host target genes which VGAM1626 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22730] Nucleotide sequences of the VGAM1626 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1626 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1626 are further described hereinbelow with reference to Table 1.

[22731] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1626 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22732] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1627 (VGAM1627) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22733] VGAM1627 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1627 was detected is described hereinabove with reference to Figs. 2-8.

[22734] VGAM1627 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1627 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22735] VGAM1627 gene, herein designated VGAM GENE, encodes a VGAM1627 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1627 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1627 precursor RNA is designated SEQ ID:1613, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1613 is located at position 80799 relative to the genome of Bovine herpesvirus 4.

[22736] VGAM1627 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22737] An enzyme complex designated DICER COMPLEX, dices the VGAM1627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1627 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1627 RNA is designated SEQ ID:4338, and is provided hereinbelow with reference to the sequence listing part.

[22738] VGAM1627 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1627 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1627 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22739] VGAM1627 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1627 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1627 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1627 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1627 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22740] The complementary binding of VGAM1627 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1627 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1627 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1627 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22741] It is appreciated that VGAM1627 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1627 host target genes. The mRNA of each one of this plurality of VGAM1627 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1627 RNA, herein designated VGAM RNA, and which when bound by VGAM1627 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1627 host target proteins.

[22742] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1627 gene, herein designated VGAM GENE, on one or more VGAM1627 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22743] It is yet further appreciated that a function of VGAM1627 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1627 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1627 correlate with, and may be deduced from, the identity of the host target genes which VGAM1627 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22744] Nucleotide sequences of the VGAM1627 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1627 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1627 are further described hereinbelow with reference to Table 1.

[22745] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1627 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22746] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1628 (VGAM1628) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22747] VGAM1628 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1628 was detected is described hereinabove with reference to Figs. 2-8.

[22748] VGAM1628 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1628 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22749] VGAM1628 gene, herein designated VGAM GENE, encodes

a VGAM1628 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1628 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1628 precursor RNA is designated SEQ ID:1614, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1614 is located at position 83406 relative to the genome of Bovine herpesvirus 4.

[22750] VGAM1628 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22751] An enzyme complex designated DICER COMPLEX, dices the VGAM1628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1628 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1628 RNA is designated SEQ ID:4339, and is provided hereinbelow with reference to the sequence listing part.

[22752] VGAM1628 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1628 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1628 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22753] VGAM1628 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1628 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1628 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1628 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1628 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22754] The complementary binding of VGAM1628 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1628 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1628 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1628 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22755] It is appreciated that VGAM1628 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1628 host target genes. The mRNA of each one of this plurality of VGAM1628 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1628 RNA, herein designated VGAM RNA, and which when bound by VGAM1628 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1628 host target proteins.

[22756] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1628 gene, herein designated VGAM GENE, on one or more VGAM1628 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22757] It is yet further appreciated that a function of VGAM1628 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1628 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1628 correlate with, and may be deduced from, the identity of the host target genes which VGAM1628 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22758] Nucleotide sequences of the VGAM1628 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1628 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1628 are further

described hereinbelow with reference to Table 1.

[22759] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1628 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22760] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1629 (VGAM1629) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22761] VGAM1629 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1629 was detected is described hereinabove with reference to Figs. 2-8.

[22762] VGAM1629 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1629 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22763] VGAM1629 gene, herein designated VGAM GENE, encodes a VGAM1629 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1629 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1629 precursor RNA is designated SEQ ID:1615, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1615 is located at position 88808 relative to the genome of Bovine herpesvirus 4.

[22764] VGAM1629 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22765] An enzyme complex designated DICER COMPLEX, dices the VGAM1629 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1629 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1629 RNA is designated SEQ ID:4340, and is provided hereinbelow with reference to the sequence listing part.

[22766] VGAM1629 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1629 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1629 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22767] VGAM1629 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1629 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1629 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1629 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1629 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22768] The complementary binding of VGAM1629 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1629 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1629

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1629 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22769] It is appreciated that VGAM1629 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1629 host target genes. The mRNA of each one of this plurality of VGAM1629 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1629 RNA, herein designated VGAM RNA, and which when bound by VGAM1629 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1629 host target proteins.

[22770] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1629 gene, herein designated VGAM GENE, on one or more VGAM1629 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22771] It is yet further appreciated that a function of VGAM1629 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1629 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1629 correlate with, and may be deduced from, the identity of the host target genes which VGAM1629 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22772] Nucleotide sequences of the VGAM1629 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1629 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1629 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1629 are further described hereinbelow with reference to Table 1.

[22773] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1629 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22774] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1630 (VGAM1630) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22775] VGAM1630 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1630 was detected is described hereinabove with reference to Figs. 2-8.

[22776] VGAM1630 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1630 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[22777] VGAM1630 gene, herein designated VGAM GENE, encodes a VGAM1630 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1630 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1630 precursor RNA is designated SEQ ID:1616, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1616 is located at position 84159 relative to the genome of Bovine herpesvirus 4.

[22778] VGAM1630 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22779] An enzyme complex designated DICER COMPLEX, dices

the VGAM1630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1630 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1630 RNA is designated SEQ ID:4341, and is provided hereinbelow with reference to the sequence listing part.

[22780] VGAM1630 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1630 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1630 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22781] VGAM1630 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1630 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1630 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1630 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1630 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22782] The complementary binding of VGAM1630 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1630 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1630 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1630 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22783] It is appreciated that VGAM1630 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1630 host target genes. The mRNA of each one of this plurality of VGAM1630 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1630 RNA, herein designated VGAM RNA, and which when bound by VGAM1630 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1630 host target proteins.

[22784] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1630 gene, herein designated VGAM GENE, on one or more VGAM1630 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22785] It is yet further appreciated that a function of VGAM1630 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1630 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1630 correlate with, and may be deduced from, the identity of the host target genes which VGAM1630 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22786] Nucleotide sequences of the VGAM1630 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1630 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1630 are further described hereinbelow with reference to Table 1.

[22787] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1630 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22788] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1631 (VGAM1631) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22789] VGAM1631 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1631 was detected is described hereinabove with reference to Figs. 2-8.

[22790] VGAM1631 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1631 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[22791] VGAM1631 gene, herein designated VGAM GENE, encodes a VGAM1631 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1631 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1631 precursor RNA is designated SEQ ID:1617, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1617 is located at position 90442 relative to the genome of Bovine herpesvirus 4.

[22792] VGAM1631 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22793] An enzyme complex designated DICER COMPLEX, dices the VGAM1631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1631 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1631 RNA is designated SEQ ID:4342, and is provided hereinbelow with reference to the sequence listing part.

[22794] VGAM1631 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1631 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1631 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22795] VGAM1631 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1631 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1631 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1631 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1631 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22796] The complementary binding of VGAM1631 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1631 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1631 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1631 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22797] It is appreciated that VGAM1631 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1631 host target genes. The mRNA of each one of this plurality of VGAM1631 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1631 RNA, herein designated VGAM RNA, and which when bound by VGAM1631 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1631 host target proteins.

[22798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1631 gene, herein designated VGAM GENE, on one or more VGAM1631 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22799] It is yet further appreciated that a function of VGAM1631 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1631 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1631 correlate with, and may be deduced from, the identity of the host target genes which VGAM1631 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22800] Nucleotide sequences of the VGAM1631 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1631 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1631 are further described hereinbelow with reference to Table 1.

[22801] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1631 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22802] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1632 (VGAM1632) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22803] VGAM1632 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1632 was detected is described hereinabove with reference to Figs. 2-8.

[22804] VGAM1632 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4.

VGAM1632 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22805] VGAM1632 gene, herein designated VGAM GENE, encodes a VGAM1632 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1632 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1632 precursor RNA is designated SEQ ID:1618, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1618 is located at position 85979 relative to the genome of Bovine herpesvirus 4.

[22806] VGAM1632 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[22807] An enzyme complex designated DICER COMPLEX, dices the VGAM1632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1632 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1632 RNA is designated SEQ ID:4343, and is provided hereinbelow with reference to the sequence listing part.

[22808] VGAM1632 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1632 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1632 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22809] VGAM1632 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1632 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1632 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1632 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1632 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22810] The complementary binding of VGAM1632 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1632 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1632 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1632 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22811] It is appreciated that VGAM1632 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1632 host target genes. The mRNA of each one of this plurality of VGAM1632 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1632 RNA, herein designated VGAM RNA, and which when bound by VGAM1632 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1632 host target proteins.

[22812] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1632 gene, herein designated VGAM GENE, on one or more VGAM1632 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22813] It is yet further appreciated that a function of VGAM1632 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1632 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1632 correlate with, and may be deduced from, the identity of the host target genes which VGAM1632 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22814] Nucleotide sequences of the VGAM1632 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1632 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1632 are further described hereinbelow with reference to Table 1.

[22815] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1632 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22816] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1633 (VGAM1633) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22817] VGAM1633 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1633 was detected is described hereinabove with reference to Figs. 2-8.

[22818] VGAM1633 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Bovine herpesvirus 4. VGAM1633 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22819] VGAM1633 gene, herein designated VGAM GENE, encodes a VGAM1633 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1633 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1633 precursor RNA is designated SEQ ID:1619, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1619 is located at position 85246 relative to the genome of Bovine herpesvirus 4.

[22820] VGAM1633 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22821] An enzyme complex designated DICER COMPLEX, dices the VGAM1633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1633 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1633 RNA is designated SEQ ID:4344, and is provided hereinbelow with reference to the sequence listing part.

[22822] VGAM1633 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1633 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1633 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22823] VGAM1633 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1633 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1633 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1633 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1633 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22824] The complementary binding of VGAM1633 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1633 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1633 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1633 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22825] It is appreciated that VGAM1633 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1633 host target genes. The mRNA of each one of this plurality of VGAM1633 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1633 RNA, herein designated VGAM RNA, and which when bound by VGAM1633 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1633 host target proteins.

[22826] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1633 gene, herein designated VGAM GENE, on one or more VGAM1633 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22827] It is yet further appreciated that a function of VGAM1633 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1633 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1633 correlate with, and may be deduced from, the identity of the host target genes which VGAM1633 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22828] Nucleotide sequences of the VGAM1633 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1633 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1633 are further described hereinbelow with reference to Table 1.

[22829] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1633 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22830] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1634 (VGAM1634) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22831] VGAM1634 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1634 was detected is described hereinabove with reference to Figs. 2-8.

[22832] VGAM1634 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1634 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22833] VGAM1634 gene, herein designated VGAM GENE, encodes a VGAM1634 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1634 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1634 precursor RNA is designated SEQ ID:1620, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1620 is located at position 81295 relative to the genome of Bovine herpesvirus 4.

[22834] VGAM1634 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22835] An enzyme complex designated DICER COMPLEX, dices the VGAM1634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1634 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1634 RNA is designated SEQ ID:4345, and is provided hereinbelow with reference to the sequence listing part.

[22836] VGAM1634 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1634 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1634 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[22837] VGAM1634 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1634 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1634 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1634 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1634 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22838] The complementary binding of VGAM1634 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1634 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1634 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1634 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22839] It is appreciated that VGAM1634 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1634 host target genes. The mRNA of each one of this plurality of VGAM1634 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1634 RNA, herein designated VGAM RNA, and which when bound by VGAM1634 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1634 host target proteins.

[22840] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1634 gene, herein designated VGAM GENE, on one

or more VGAM1634 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22841] It is yet further appreciated that a function of VGAM1634 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1634 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1634 correlate with, and may be deduced from, the identity of the host target genes which VGAM1634 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22842] Nucleotide sequences of the VGAM1634 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1634 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1634 are further described hereinbelow with reference to Table 1.

[22843] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1634 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22844] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1635 (VGAM1635) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22845] VGAM1635 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1635 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[22846] VGAM1635 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1635 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22847] VGAM1635 gene, herein designated VGAM GENE, encodes a VGAM1635 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1635 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1635 precursor RNA is designated SEQ ID:1621, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1621 is located at position 121659 relative to the genome of Human herpesvirus 8.

[22848] VGAM1635 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22849] An enzyme complex designated DICER COMPLEX, dices the VGAM1635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1635 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1635 RNA is designated SEQ ID:4346, and is provided hereinbelow with reference to the sequence listing part.

[22850] VGAM1635 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1635 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1635 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22851] VGAM1635 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1635 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1635 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1635 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1635 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[22852] The complementary binding of VGAM1635 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1635 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1635 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1635 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22853] It is appreciated that VGAM1635 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1635 host target genes. The mRNA of each one of this plurality of VGAM1635 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1635 RNA, herein designated VGAM RNA, and which when bound by VGAM1635 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1635 host target proteins.

[22854] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1635 gene, herein designated VGAM GENE, on one or more VGAM1635 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22855] It is yet further appreciated that a function of VGAM1635 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1635 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1635 correlate with, and may be deduced from, the identity of the host target genes which VGAM1635 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[22856] Nucleotide sequences of the VGAM1635 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1635 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1635 are further described hereinbelow with reference to Table 1.

[22857] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1635 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22858] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1636 (VGAM1636) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22859] VGAM1636 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1636 was detected is described hereinabove with reference to Figs. 2-8.

[22860] VGAM1636 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1636 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22861] VGAM1636 gene, herein designated VGAM GENE, encodes a VGAM1636 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1636 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1636 precursor RNA is designated SEQ ID:1622, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1622 is located at position 119152 relative to the genome of Human herpesvirus 8.

[22862] VGAM1636 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22863] An enzyme complex designated DICER COMPLEX, dices the VGAM1636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1636 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1636 RNA is designated SEQ ID:4347, and is provided hereinbelow with reference to the sequence listing part.

[22864] VGAM1636 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1636 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1636 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22865] VGAM1636 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1636 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1636 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1636 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1636 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22866] The complementary binding of VGAM1636 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1636 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1636 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1636 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22867] It is appreciated that VGAM1636 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1636 host target genes. The mRNA of each one of this plurality of VGAM1636 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1636 RNA, herein designated VGAM RNA, and which when bound by VGAM1636 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1636 host target proteins.

[22868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1636 gene, herein designated VGAM GENE, on one or more VGAM1636 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22869] It is yet further appreciated that a function of VGAM1636 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1636 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1636 correlate with, and may be deduced from, the identity of the host target genes which VGAM1636 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[22870] Nucleotide sequences of the VGAM1636 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1636 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1636 are further described hereinbelow with reference to Table 1.

[22871] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1636 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22872] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1637 (VGAM1637) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22873] VGAM1637 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1637 was detected is described hereinabove with reference to Figs. 2-8.

[22874] VGAM1637 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1637 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22875] VGAM1637 gene, herein designated VGAM GENE, encodes a VGAM1637 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1637 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1637 precursor RNA is designated SEQ ID:1623, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1623 is located at position 122480 relative to the genome of Human herpesvirus 8.

[22876] VGAM1637 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22877] An enzyme complex designated DICER COMPLEX, dices the VGAM1637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1637 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1637 RNA is designated SEQ ID:4348, and is provided hereinbelow with reference to the sequence listing part.

[22878] VGAM1637 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1637 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1637 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22879] VGAM1637 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1637 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1637 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1637 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1637 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22880] The complementary binding of VGAM1637 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1637 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1637 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1637 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22881] It is appreciated that VGAM1637 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1637 host target genes. The mRNA of each one of this plurality of VGAM1637 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1637 RNA, herein designated VGAM RNA, and which when bound by VGAM1637 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1637 host target proteins.

[22882] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1637 gene, herein designated VGAM GENE, on one or more VGAM1637 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22883] It is yet further appreciated that a function of VGAM1637 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1637 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1637 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1637 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22884] Nucleotide sequences of the VGAM1637 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1637 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1637 are further described hereinbelow with reference to Table 1.

[22885] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1637 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22886] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1638 (VGAM1638) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22887] VGAM1638 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1638 was detected is described hereinabove with reference to Figs. 2-8.

[22888] VGAM1638 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1638 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22889] VGAM1638 gene, herein designated VGAM GENE, encodes a VGAM1638 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1638 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1638 precursor RNA is designated SEQ ID:1624, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1624 is located at position 124374 relative to the genome of Human herpesvirus 8.

[22890] VGAM1638 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1638 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22891] An enzyme complex designated DICER COMPLEX, dices the VGAM1638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1638 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1638 RNA is designated SEQ ID:4349, and is provided hereinbelow with reference to the sequence listing part.

[22892] VGAM1638 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1638 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1638 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22893] VGAM1638 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1638 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1638 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1638 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1638 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22894] The complementary binding of VGAM1638 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1638 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1638 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1638 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22895] It is appreciated that VGAM1638 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1638 host target genes. The mRNA of each one of this plurality of VGAM1638 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1638 RNA, herein designated VGAM RNA, and which when bound by VGAM1638 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1638 host target proteins.

[22896] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1638 gene, herein designated VGAM GENE, on one or more VGAM1638 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22897] It is yet further appreciated that a function of VGAM1638 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1638 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1638

correlate with, and may be deduced from, the identity of the host target genes which VGAM1638 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22898] Nucleotide sequences of the VGAM1638 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1638 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1638 are further described hereinbelow with reference to Table 1.

[22899] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1638 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22900] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1639 (VGAM1639) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[22901] VGAM1639 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1639 was detected is described hereinabove with reference to Figs. 2-8.

[22902] VGAM1639 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1639 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22903] VGAM1639 gene, herein designated VGAM GENE, encodes a VGAM1639 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1639 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1639 precursor RNA is designated SEQ ID:1625, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1625 is located at position 121407 relative to the genome of Human herpesvirus 8.

[22904] VGAM1639 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1639 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22905] An enzyme complex designated DICER COMPLEX, dices the VGAM1639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1639 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1639 RNA is designated SEQ ID:4350, and is provided hereinbelow with reference to the sequence listing part.

[22906] VGAM1639 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1639 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1639 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22907] VGAM1639 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1639 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1639 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1639 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1639 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22908] The complementary binding of VGAM1639 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1639 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1639 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1639 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22909] It is appreciated that VGAM1639 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1639 host target genes. The mRNA of each one of this plurality of VGAM1639 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1639 RNA, herein designated VGAM RNA, and which when bound by VGAM1639 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1639 host target proteins.

[22910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1639 gene, herein designated VGAM GENE, on one or more VGAM1639 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22911] It is yet further appreciated that a function of VGAM1639 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1639 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Spe-

cific functions, and accordingly utilities, of VGAM1639 correlate with, and may be deduced from, the identity of the host target genes which VGAM1639 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22912] Nucleotide sequences of the VGAM1639 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1639 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1639 are further described hereinbelow with reference to Table 1.

[22913] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1639 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22914] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1640 (VGAM1640) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[22915] VGAM1640 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1640 was detected is described hereinabove with reference to Figs. 2-8.

[22916] VGAM1640 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1640 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22917] VGAM1640 gene, herein designated VGAM GENE, encodes a VGAM1640 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1640 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1640 precursor RNA is designated SEQ ID:1626, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1626 is located at position 117446 relative to the genome of Human herpesvirus 8.

[22918] VGAM1640 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22919] An enzyme complex designated DICER COMPLEX, dices the VGAM1640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1640 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1640 RNA is designated SEQ ID:4351, and is provided hereinbelow with reference to the sequence listing part.

[22920] VGAM1640 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1640 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1640 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22921] VGAM1640 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1640 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1640 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1640 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1640 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22922] The complementary binding of VGAM1640 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1640 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1640 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1640 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22923] It is appreciated that VGAM1640 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1640 host target genes. The mRNA of each one of this plurality of VGAM1640 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1640 RNA, herein designated VGAM RNA, and which when bound by VGAM1640 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1640 host target proteins.

[22924] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1640 gene, herein designated VGAM GENE, on one or more VGAM1640 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22925] It is yet further appreciated that a function of VGAM1640 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1640 include diagnosis, prevention and

treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1640 correlate with, and may be deduced from, the identity of the host target genes which VGAM1640 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22926] Nucleotide sequences of the VGAM1640 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1640 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1640 are further described hereinbelow with reference to Table 1.

[22927] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1640 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22928] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1641 (VGAM1641) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22929] VGAM1641 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1641 was detected is described hereinabove with reference to Figs. 2-8.

[22930] VGAM1641 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cell fusing agent virus. VGAM1641 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22931] VGAM1641 gene, herein designated VGAM GENE, encodes a VGAM1641 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1641 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1641 precursor RNA is designated SEQ ID:1627, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1627 is located at position 9147 relative to the genome of Cell fusing agent virus.

[22932] VGAM1641 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22933] An enzyme complex designated DICER COMPLEX, dices the VGAM1641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1641 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1641 RNA is designated SEQ ID:4352, and is provided hereinbelow with reference to the sequence listing part.

[22934] VGAM1641 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1641 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1641 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22935] VGAM1641 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1641 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1641 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1641 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1641 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22936] The complementary binding of VGAM1641 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1641 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1641 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1641 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22937] It is appreciated that VGAM1641 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1641 host target genes. The mRNA of each one of this plurality of VGAM1641 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1641 RNA, herein designated VGAM

RNA, and which when bound by VGAM1641 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1641 host target proteins.

[22938] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1641 gene, herein designated VGAM GENE, on one or more VGAM1641 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22939] It is yet further appreciated that a function of VGAM1641 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1641 include diagnosis, prevention and treatment of viral infection by Cell fusing agent virus. Specific functions, and accordingly utilities, of VGAM1641 correlate with, and may be deduced from, the identity of the host target genes which VGAM1641 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22940] Nucleotide sequences of the VGAM1641 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1641 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1641 are further described hereinbelow with reference to Table 1.

[22941] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1641 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22942] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1642 (VGAM1642) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22943] VGAM1642 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1642 was detected is described hereinabove with reference to Figs. 2-8.

[22944] VGAM1642 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cell fusing agent virus. VGAM1642 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22945] VGAM1642 gene, herein designated VGAM GENE, encodes a VGAM1642 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1642 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1642 precursor RNA is designated SEQ ID:1628, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1628 is located at position 8550

relative to the genome of Cell fusing agent virus.

[22946] VGAM1642 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22947] An enzyme complex designated DICER COMPLEX, dices the VGAM1642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1642 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1642 RNA is designated SEQ ID:4353, and is provided hereinbelow with reference to the sequence listing part.

[22948] VGAM1642 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1642 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1642 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22949] VGAM1642 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1642 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1642 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1642 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1642 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22950] The complementary binding of VGAM1642 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1642 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1642 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1642 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22951] It is appreciated that VGAM1642 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1642 host target genes. The mRNA of each one of this plurality of VGAM1642 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1642 RNA, herein designated VGAM RNA, and which when bound by VGAM1642 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1642 host target proteins.

[22952] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1642 gene, herein designated VGAM GENE, on one or more VGAM1642 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22953] It is yet further appreciated that a function of VGAM1642 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1642 include diagnosis, prevention and treatment of viral infection by Cell fusing agent virus. Specific functions, and accordingly utilities, of VGAM1642 correlate with, and may be deduced from, the identity of the host target genes which VGAM1642 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22954] Nucleotide sequences of the VGAM1642 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1642 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1642 are further described hereinbelow with reference to Table 1.

[22955] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1642 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22956] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1643 (VGAM1643) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22957] VGAM1643 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1643 was detected is described hereinabove with reference to Figs. 2-8.

[22958] VGAM1643 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cell fusing agent virus. VGAM1643 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22959] VGAM1643 gene, herein designated VGAM GENE, encodes a VGAM1643 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1643 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1643 precursor RNA is designated SEQ ID:1629, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1629 is located at position 1340 relative to the genome of Cell fusing agent virus.

[22960] VGAM1643 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22961] An enzyme complex designated DICER COMPLEX, dices the VGAM1643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1643 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1643 RNA is designated SEQ ID:4354, and is provided hereinbelow with reference to the sequence

listing part.

[22962] VGAM1643 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1643 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1643 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22963] VGAM1643 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1643 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1643 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1643 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1643 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22964] The complementary binding of VGAM1643 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1643 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1643 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1643 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22965] It is appreciated that VGAM1643 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1643 host target genes. The mRNA of each one of this plurality of VGAM1643 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1643 RNA, herein designated VGAM RNA, and which when bound by VGAM1643 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1643 host target proteins.

[22966] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1643 gene, herein designated VGAM GENE, on one or more VGAM1643 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22967] It is yet further appreciated that a function of VGAM1643

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1643 include diagnosis, prevention and treatment of viral infection by Cell fusing agent virus. Specific functions, and accordingly utilities, of VGAM1643 correlate with, and may be deduced from, the identity of the host target genes which VGAM1643 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22968] Nucleotide sequences of the VGAM1643 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1643 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1643 are further described hereinbelow with reference to Table 1.

[22969] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1643 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22970] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1644 (VGAM1644) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22971] VGAM1644 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1644 was detected is described hereinabove with reference to Figs. 2-8.

[22972] VGAM1644 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Dengue virus. VGAM1644 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22973] VGAM1644 gene, herein designated VGAM GENE, encodes a VGAM1644 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1644 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1644 precursor RNA is designated SEQ ID:1630, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1630 is located at position 10625 relative to the genome of Dengue virus.

[22974] VGAM1644 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22975] An enzyme complex designated DICER COMPLEX, dices the VGAM1644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1644 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1644 RNA is designated SEQ ID:4355, and

is provided hereinbelow with reference to the sequence listing part.

[22976] VGAM1644 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1644 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1644 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22977] VGAM1644 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1644 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1644 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1644 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1644 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22978] The complementary binding of VGAM1644 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1644 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1644 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1644 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22979] It is appreciated that VGAM1644 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1644 host target genes. The mRNA of each one of this plurality of VGAM1644 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1644 RNA, herein designated VGAM RNA, and which when bound by VGAM1644 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1644 host target proteins.

[22980] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1644 gene, herein designated VGAM GENE, on one or more VGAM1644 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22981] It is yet further appreciated that a function of VGAM1644 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1644 include diagnosis, prevention and treatment of viral infection by Dengue virus. Specific functions, and accordingly utilities, of VGAM1644 correlate with, and may be deduced from, the identity of the host target genes which VGAM1644 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22982] Nucleotide sequences of the VGAM1644 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1644 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1644 are further described hereinbelow with reference to Table 1.

[22983] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1644 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22984] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1645 (VGAM1645) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22985] VGAM1645 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1645 was detected is described hereinabove with reference to Figs. 2-8.

[22986] VGAM1645 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Dengue virus.
VGAM1645 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22987] VGAM1645 gene, herein designated VGAM GENE, encodes a VGAM1645 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1645 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1645 precur-

sor RNA is designated SEQ ID:1631, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1631 is located at position 5184 relative to the genome of Dengue virus.

[22988] VGAM1645 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22989] An enzyme complex designated DICER COMPLEX, dices the VGAM1645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1645 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM1645 RNA is designated SEQ ID:4356, and is provided hereinbelow with reference to the sequence listing part.

[22990] VGAM1645 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1645 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1645 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22991] VGAM1645 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1645 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1645 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1645 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1645 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22992] The complementary binding of VGAM1645 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1645 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1645 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1645 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22993] It is appreciated that VGAM1645 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1645 host target genes. The mRNA of

each one of this plurality of VGAM1645 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1645 RNA, herein designated VGAM RNA, and which when bound by VGAM1645 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1645 host target proteins.

[22994] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1645 gene, herein designated VGAM GENE, on one or more VGAM1645 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[22995] It is yet further appreciated that a function of VGAM1645 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1645 include diagnosis, prevention and treatment of viral infection by Dengue virus. Specific functions, and accordingly utilities, of VGAM1645 correlate with, and may be deduced from, the identity of the host target genes which VGAM1645 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22996] Nucleotide sequences of the VGAM1645 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1645 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1645 are further described hereinbelow with reference to Table 1.

[22997] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1645 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[22998] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1646 (VGAM1646) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22999] VGAM1646 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1646 was detected is described hereinabove with reference to Figs. 2-8.

[23000] VGAM1646 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Dengue virus.
VGAM1646 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23001] VGAM1646 gene, herein designated VGAM GENE, encodes a VGAM1646 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1646 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1646 precursor RNA is designated SEQ ID:1632, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1632 is located at position 9914 relative to the genome of Dengue virus.

[23002] VGAM1646 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23003] An enzyme complex designated DICER COMPLEX, dices the VGAM1646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1646 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1646 RNA is designated SEQ ID:4357, and is provided hereinbelow with reference to the sequence listing part.

[23004] VGAM1646 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1646 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1646 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23005] VGAM1646 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1646 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1646 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1646 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1646 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23006] The complementary binding of VGAM1646 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1646 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1646 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1646 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23007] It is appreciated that VGAM1646 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1646 host target genes. The mRNA of each one of this plurality of VGAM1646 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1646 RNA, herein designated VGAM RNA, and which when bound by VGAM1646 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1646 host target proteins.

[23008] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1646 gene, herein designated VGAM GENE, on one or more VGAM1646 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23009] It is yet further appreciated that a function of VGAM1646 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1646 include diagnosis, prevention and treatment of viral infection by Dengue virus. Specific functions, and accordingly utilities, of VGAM1646 correlate with, and may be deduced from, the identity of the host target genes which VGAM1646 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23010] Nucleotide sequences of the VGAM1646 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1646 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1646 are further described hereinbelow with reference to Table 1.

[23011] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1646 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23012] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1647 (VGAM1647) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23013] VGAM1647 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1647 was detected is described hereinabove with reference to Figs. 2-8.

[23014] VGAM1647 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1647 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23015] VGAM1647 gene, herein designated VGAM GENE, encodes a VGAM1647 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1647 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1647 precursor RNA is designated SEQ ID:1633, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1633 is located at position 104577 relative to the genome of Human herpesvirus 8.

[23016] VGAM1647 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23017] An enzyme complex designated DICER COMPLEX, dices the VGAM1647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1647 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1647 RNA is designated SEQ ID:4358, and is provided hereinbelow with reference to the sequence listing part.

[23018] VGAM1647 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1647 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1647 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23019] VGAM1647 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1647 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1647 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1647 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1647 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23020] The complementary binding of VGAM1647 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1647 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1647 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1647 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23021] It is appreciated that VGAM1647 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1647 host target genes. The mRNA of each one of this plurality of VGAM1647 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1647 RNA, herein designated VGAM RNA, and which when bound by VGAM1647 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1647 host target proteins.

[23022] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1647 gene, herein designated VGAM GENE, on one or more VGAM1647 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23023] It is yet further appreciated that a function of VGAM1647 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1647 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1647 correlate with, and may be deduced from, the identity of the host target genes which VGAM1647 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23024] Nucleotide sequences of the VGAM1647 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1647 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1647 are further described hereinbelow with reference to Table 1.

[23025] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1647 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23026] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1648 (VGAM1648) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23027] VGAM1648 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1648 was detected is described hereinabove with reference to Figs. 2-8.

[23028] VGAM1648 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1648 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23029] VGAM1648 gene, herein designated VGAM GENE, encodes a VGAM1648 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1648 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1648 precursor RNA is designated SEQ ID:1634, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1634 is located at position 111049 relative to the genome of Human herpesvirus 8.

[23030] VGAM1648 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23031] An enzyme complex designated DICER COMPLEX, dices the VGAM1648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1648 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1648 RNA is designated SEQ ID:4359, and is provided hereinbelow with reference to the sequence listing part.

[23032] VGAM1648 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1648 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1648 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23033] VGAM1648 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1648 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1648 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1648 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1648 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23034] The complementary binding of VGAM1648 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1648 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1648 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1648 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23035] It is appreciated that VGAM1648 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1648 host target genes. The mRNA of each one of this plurality of VGAM1648 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1648 RNA, herein designated VGAM RNA, and which when bound by VGAM1648 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1648 host target proteins.

[23036] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1648 gene, herein designated VGAM GENE, on one or more VGAM1648 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23037] It is yet further appreciated that a function of VGAM1648 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1648 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1648 correlate with, and may be deduced from, the identity of the host target genes which VGAM1648 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23038] Nucleotide sequences of the VGAM1648 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1648 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1648 are further described hereinbelow with reference to Table 1.

[23039] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1648 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23040] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1649 (VGAM1649) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23041] VGAM1649 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1649 was detected is described hereinabove with reference to Figs. 2-8.

[23042] VGAM1649 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1649 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23043] VGAM1649 gene, herein designated VGAM GENE, encodes a VGAM1649 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1649 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1649 precursor RNA is designated SEQ ID:1635, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1635 is located at position 105452 relative to the genome of Human herpesvirus 8.

[23044] VGAM1649 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23045] An enzyme complex designated DICER COMPLEX, dices the VGAM1649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1649 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1649 RNA is designated SEQ ID:4360, and is provided hereinbelow with reference to the sequence listing part.

[23046] VGAM1649 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1649 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1649 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23047] VGAM1649 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1649 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1649 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1649 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1649 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23048] The complementary binding of VGAM1649 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1649 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1649 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1649 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[23049] It is appreciated that VGAM1649 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1649 host target genes. The mRNA of each one of this plurality of VGAM1649 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1649 RNA, herein designated VGAM RNA, and which when bound by VGAM1649 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1649 host target proteins.

[23050] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1649 gene, herein designated VGAM GENE, on one or more VGAM1649 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23051] It is yet further appreciated that a function of VGAM1649 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1649 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1649 correlate with, and may be deduced from, the identity of the host target genes which VGAM1649 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23052] Nucleotide sequences of the VGAM1649 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1649 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1649 are further described hereinbelow with reference to Table 1.

[23053] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1649 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23054] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1650 (VGAM1650) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23055] VGAM1650 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1650 was detected is described hereinabove with reference to Figs. 2-8.

[23056] VGAM1650 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1650 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23057] VGAM1650 gene, herein designated VGAM GENE, encodes a VGAM1650 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1650 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1650 precursor RNA is designated SEQ ID:1636, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1636 is located at position 109181 relative to the genome of Human herpesvirus 8.

[23058] VGAM1650 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23059] An enzyme complex designated DICER COMPLEX, dices the VGAM1650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1650 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1650 RNA is designated SEQ ID:4361, and is provided hereinbelow with reference to the sequence listing part.

[23060] VGAM1650 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1650 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1650 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23061] VGAM1650 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1650 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1650 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1650 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1650 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23062] The complementary binding of VGAM1650 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1650 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1650 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1650 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23063] It is appreciated that VGAM1650 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1650 host target genes. The mRNA of each one of this plurality of VGAM1650 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1650 RNA, herein designated VGAM RNA, and which when bound by VGAM1650 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1650 host target proteins.

[23064] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1650 gene, herein designated VGAM GENE, on one or more VGAM1650 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23065] It is yet further appreciated that a function of VGAM1650 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1650 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1650 correlate with, and may be deduced from, the identity of the host target genes which VGAM1650 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23066] Nucleotide sequences of the VGAM1650 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1650 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1650 are further described hereinbelow with reference to Table 1.

[23067] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1650 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23068] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1651 (VGAM1651) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23069] VGAM1651 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1651 was detected is described hereinabove with reference to Figs. 2-8.

[23070] VGAM1651 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1651 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23071] VGAM1651 gene, herein designated VGAM GENE, encodes

a VGAM1651 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1651 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1651 precursor RNA is designated SEQ ID:1637, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1637 is located at position 106255 relative to the genome of Human herpesvirus 8.

[23072] VGAM1651 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23073] An enzyme complex designated DICER COMPLEX, dices the VGAM1651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1651 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1651 RNA is designated SEQ ID:4362, and is provided hereinbelow with reference to the sequence listing part.

[23074] VGAM1651 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1651 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1651 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23075] VGAM1651 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1651 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1651 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1651 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1651 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23076] The complementary binding of VGAM1651 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1651 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1651 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1651 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23077] It is appreciated that VGAM1651 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1651 host target genes. The mRNA of each one of this plurality of VGAM1651 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1651 RNA, herein designated VGAM RNA, and which when bound by VGAM1651 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1651 host target proteins.

[23078] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1651 gene, herein designated VGAM GENE, on one or more VGAM1651 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23079] It is yet further appreciated that a function of VGAM1651 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1651 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1651 correlate with, and may be deduced from, the identity of the host target genes which VGAM1651 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23080] Nucleotide sequences of the VGAM1651 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1651 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1651 are further

described hereinbelow with reference to Table 1.

[23081] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1651 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23082] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1652 (VGAM1652) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23083] VGAM1652 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1652 was detected is described hereinabove with reference to Figs. 2-8.

[23084] VGAM1652 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yellow fever virus. VGAM1652 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23085] VGAM1652 gene, herein designated VGAM GENE, encodes a VGAM1652 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1652 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1652 precursor RNA is designated SEQ ID:1638, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1638 is located at position 10776 relative to the genome of Yellow fever virus.

[23086] VGAM1652 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23087] An enzyme complex designated DICER COMPLEX, dices the VGAM1652 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1652 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1652 RNA is designated SEQ ID:4363, and is provided hereinbelow with reference to the sequence listing part.

[23088] VGAM1652 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1652 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1652 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23089] VGAM1652 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1652 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1652 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1652 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1652 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23090] The complementary binding of VGAM1652 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1652 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1652

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1652 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23091] It is appreciated that VGAM1652 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1652 host target genes. The mRNA of each one of this plurality of VGAM1652 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1652 RNA, herein designated VGAM RNA, and which when bound by VGAM1652 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1652 host target proteins.

[23092] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1652 gene, herein designated VGAM GENE, on one or more VGAM1652 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23093] It is yet further appreciated that a function of VGAM1652 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1652 include diagnosis, prevention and treatment of viral infection by Yellow fever virus. Specific functions, and accordingly utilities, of VGAM1652 correlate with, and may be deduced from, the identity of the host target genes which VGAM1652 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23094] Nucleotide sequences of the VGAM1652 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1652 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1652 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1652 are further described hereinbelow with reference to Table 1.

[23095] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1652 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23096] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1653 (VGAM1653) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23097] VGAM1653 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1653 was detected is described hereinabove with reference to Figs. 2-8.

[23098] VGAM1653 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yellow fever virus. VGAM1653 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[23099] VGAM1653 gene, herein designated VGAM GENE, encodes a VGAM1653 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1653 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1653 precursor RNA is designated SEQ ID:1639, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1639 is located at position 2036 relative to the genome of Yellow fever virus.

[23100] VGAM1653 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23101] An enzyme complex designated DICER COMPLEX, dices

the VGAM1653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1653 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1653 RNA is designated SEQ ID:4364, and is provided hereinbelow with reference to the sequence listing part.

[23102] VGAM1653 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1653 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1653 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23103] VGAM1653 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1653 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1653 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1653 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1653 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23104] The complementary binding of VGAM1653 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1653 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1653 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1653 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23105] It is appreciated that VGAM1653 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1653 host target genes. The mRNA of each one of this plurality of VGAM1653 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1653 RNA, herein designated VGAM RNA, and which when bound by VGAM1653 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1653 host target proteins.

[23106] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1653 gene, herein designated VGAM GENE, on one or more VGAM1653 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23107] It is yet further appreciated that a function of VGAM1653 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1653 include diagnosis, prevention and treatment of viral infection by Yellow fever virus. Specific functions, and accordingly utilities, of VGAM1653 correlate with, and may be deduced from, the identity of the host target genes which VGAM1653 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23108] Nucleotide sequences of the VGAM1653 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1653 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1653 are further described hereinbelow with reference to Table 1.

[23109] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1653 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23110] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1654 (VGAM1654) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23111] VGAM1654 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1654 was detected is described hereinabove with reference to Figs. 2-8.

[23112] VGAM1654 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yellow fever virus. VGAM1654 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[23113] VGAM1654 gene, herein designated VGAM GENE, encodes a VGAM1654 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1654 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1654 precursor RNA is designated SEQ ID:1640, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1640 is located at position 6577 relative to the genome of Yellow fever virus.

[23114] VGAM1654 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23115] An enzyme complex designated DICER COMPLEX, dices the VGAM1654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1654 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1654 RNA is designated SEQ ID:4365, and is provided hereinbelow with reference to the sequence listing part.

[23116] VGAM1654 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1654 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1654 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23117] VGAM1654 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1654 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1654 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1654 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1654 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23118] The complementary binding of VGAM1654 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1654 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1654 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1654 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23119] It is appreciated that VGAM1654 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1654 host target genes. The mRNA of each one of this plurality of VGAM1654 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1654 RNA, herein designated VGAM RNA, and which when bound by VGAM1654 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1654 host target proteins.

[23120] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1654 gene, herein designated VGAM GENE, on one or more VGAM1654 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23121] It is yet further appreciated that a function of VGAM1654 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1654 include diagnosis, prevention and treatment of viral infection by Yellow fever virus. Specific functions, and accordingly utilities, of VGAM1654 correlate with, and may be deduced from, the identity of the host target genes which VGAM1654 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23122] Nucleotide sequences of the VGAM1654 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1654 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1654 are further described hereinbelow with reference to Table 1.

[23123] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1654 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23124] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1655 (VGAM1655) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23125] VGAM1655 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1655 was detected is described hereinabove with reference to Figs. 2-8.

[23126] VGAM1655 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yellow fever virus.

VGAM1655 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23127] VGAM1655 gene, herein designated VGAM GENE, encodes a VGAM1655 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1655 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1655 precursor RNA is designated SEQ ID:1641, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1641 is located at position 1472 relative to the genome of Yellow fever virus.

[23128] VGAM1655 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[23129] An enzyme complex designated DICER COMPLEX, dices the VGAM1655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1655 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1655 RNA is designated SEQ ID:4366, and is provided hereinbelow with reference to the sequence listing part.

[23130] VGAM1655 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1655 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1655 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23131] VGAM1655 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1655 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1655 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1655 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1655 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23132] The complementary binding of VGAM1655 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1655 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1655 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1655 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23133] It is appreciated that VGAM1655 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1655 host target genes. The mRNA of each one of this plurality of VGAM1655 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1655 RNA, herein designated VGAM RNA, and which when bound by VGAM1655 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1655 host target proteins.

[23134] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1655 gene, herein designated VGAM GENE, on one or more VGAM1655 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23135] It is yet further appreciated that a function of VGAM1655 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1655 include diagnosis, prevention and treatment of viral infection by Yellow fever virus. Specific functions, and accordingly utilities, of VGAM1655 correlate with, and may be deduced from, the identity of the host target genes which VGAM1655 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23136] Nucleotide sequences of the VGAM1655 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1655 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1655 are further described hereinbelow with reference to Table 1.

[23137] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1655 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23138] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1656 (VGAM1656) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23139] VGAM1656 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1656 was detected is described hereinabove with reference to Figs. 2-8.

[23140] VGAM1656 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Molluscum contagiosum virus. VGAM1656 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23141] VGAM1656 gene, herein designated VGAM GENE, encodes a VGAM1656 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1656 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1656 precursor RNA is designated SEQ ID:1642, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1642 is located at position 8730 relative to the genome of Molluscum contagiosum virus.

[23142] VGAM1656 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23143] An enzyme complex designated DICER COMPLEX, dices the VGAM1656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1656 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1656 RNA is designated SEQ ID:4367, and is provided hereinbelow with reference to the sequence listing part.

[23144] VGAM1656 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1656 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1656 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23145] VGAM1656 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1656 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1656 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1656 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1656 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23146] The complementary binding of VGAM1656 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1656 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1656 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1656 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23147] It is appreciated that VGAM1656 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1656 host target genes. The mRNA of each one of this plurality of VGAM1656 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1656 RNA, herein designated VGAM RNA, and which when bound by VGAM1656 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1656 host target proteins.

[23148] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1656 gene, herein designated VGAM GENE, on one or more VGAM1656 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23149] It is yet further appreciated that a function of VGAM1656 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1656 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM1656 correlate with, and may be deduced from, the identity of the host target genes which VGAM1656 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23150] Nucleotide sequences of the VGAM1656 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1656 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1656 are further described hereinbelow with reference to Table 1.

[23151] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1656 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23152] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1657 (VGAM1657) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23153] VGAM1657 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1657 was detected is described hereinabove with reference to Figs. 2-8.

[23154] VGAM1657 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM1657 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23155] VGAM1657 gene, herein designated VGAM GENE, encodes a VGAM1657 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1657 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1657 precursor RNA is designated SEQ ID:1643, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1643 is located at position 9944 relative to the genome of Molluscum contagiosum virus.

[23156] VGAM1657 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23157] An enzyme complex designated DICER COMPLEX, dices the VGAM1657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1657 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1657 RNA is designated SEQ ID:4368, and is provided hereinbelow with reference to the sequence listing part.

[23158] VGAM1657 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1657 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1657 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[23159] VGAM1657 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1657 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1657 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1657 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1657 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23160] The complementary binding of VGAM1657 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1657 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1657 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1657 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23161] It is appreciated that VGAM1657 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1657 host target genes. The mRNA of each one of this plurality of VGAM1657 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1657 RNA, herein designated VGAM RNA, and which when bound by VGAM1657 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1657 host target proteins.

[23162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1657 gene, herein designated VGAM GENE, on one

or more VGAM1657 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23163] It is yet further appreciated that a function of VGAM1657 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1657 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM1657 correlate with, and may be deduced from, the identity of the host target genes which VGAM1657 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23164] Nucleotide sequences of the VGAM1657 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1657 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1657 are further described hereinbelow with reference to Table 1.

[23165] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1657 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23166] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1658 (VGAM1658) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23167] VGAM1658 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1658 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[23168] VGAM1658 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM1658 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23169] VGAM1658 gene, herein designated VGAM GENE, encodes a VGAM1658 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1658 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1658 precursor RNA is designated SEQ ID:1644, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1644 is located at position 9453 relative to the genome of Molluscum contagiosum virus.

[23170] VGAM1658 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23171] An enzyme complex designated DICER COMPLEX, dices the VGAM1658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1658 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1658 RNA is designated SEQ ID:4369, and is provided hereinbelow with reference to the sequence listing part.

[23172] VGAM1658 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1658 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1658 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23173] VGAM1658 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1658 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1658 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1658 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1658 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[23174] The complementary binding of VGAM1658 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1658 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1658 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1658 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23175] It is appreciated that VGAM1658 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1658 host target genes. The mRNA of each one of this plurality of VGAM1658 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1658 RNA, herein designated VGAM RNA, and which when bound by VGAM1658 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1658 host target proteins.

[23176] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1658 gene, herein designated VGAM GENE, on one or more VGAM1658 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23177] It is yet further appreciated that a function of VGAM1658 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1658 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM1658 correlate with, and may be deduced from, the identity of the host target genes which VGAM1658 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[23178] Nucleotide sequences of the VGAM1658 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1658 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1658 are further described hereinbelow with reference to Table 1.

[23179] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1658 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23180] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1659 (VGAM1659) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23181] VGAM1659 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1659 was detected is described hereinabove with reference to Figs. 2-8.

[23182] VGAM1659 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM1659 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23183] VGAM1659 gene, herein designated VGAM GENE, encodes a VGAM1659 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1659 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1659 precursor RNA is designated SEQ ID:1645, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1645 is located at position 13023 relative to the genome of Molluscum contagiosum virus.

[23184] VGAM1659 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23185] An enzyme complex designated DICER COMPLEX, dices the VGAM1659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1659 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1659 RNA is designated SEQ ID:4370, and is provided hereinbelow with reference to the sequence listing part.

[23186] VGAM1659 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1659 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1659 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23187] VGAM1659 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1659 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1659 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1659 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1659 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23188] The complementary binding of VGAM1659 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1659 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1659 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1659 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23189] It is appreciated that VGAM1659 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1659 host target genes. The mRNA of each one of this plurality of VGAM1659 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1659 RNA, herein designated VGAM RNA, and which when bound by VGAM1659 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1659 host target proteins.

[23190] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1659 gene, herein designated VGAM GENE, on one or more VGAM1659 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23191] It is yet further appreciated that a function of VGAM1659 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1659 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM1659 correlate with, and may be deduced from, the

identity of the host target genes which VGAM1659 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23192] Nucleotide sequences of the VGAM1659 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1659 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1659 are further described hereinbelow with reference to Table 1.

[23193] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1659 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23194] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1660 (VGAM1660) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23195] VGAM1660 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1660 was detected is described hereinabove with reference to Figs. 2-8.

[23196] VGAM1660 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM1660 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23197] VGAM1660 gene, herein designated VGAM GENE, encodes a VGAM1660 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1660 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1660 precursor RNA is designated SEQ ID:1646, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1646 is located at position 5477 relative to the genome of Molluscum contagiosum virus.

[23198] VGAM1660 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1660 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23199] An enzyme complex designated DICER COMPLEX, dices the VGAM1660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1660 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1660 RNA is designated SEQ ID:4371, and is provided hereinbelow with reference to the sequence listing part.

[23200] VGAM1660 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1660 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1660 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23201] VGAM1660 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1660 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1660 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1660 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1660 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23202] The complementary binding of VGAM1660 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1660 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1660 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1660 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23203] It is appreciated that VGAM1660 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1660 host target genes. The mRNA of each one of this plurality of VGAM1660 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1660 RNA, herein designated VGAM RNA, and which when bound by VGAM1660 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1660 host target proteins.

[23204] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1660 gene, herein designated VGAM GENE, on one or more VGAM1660 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23205] It is yet further appreciated that a function of VGAM1660 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1660 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of

VGAM1660 correlate with, and may be deduced from, the identity of the host target genes which VGAM1660 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23206] Nucleotide sequences of the VGAM1660 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1660 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1660 are further described hereinbelow with reference to Table 1.

[23207] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1660 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23208] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1661 (VGAM1661) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[23209] VGAM1661 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1661 was detected is described hereinabove with reference to Figs. 2-8.

[23210] VGAM1661 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1661 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23211] VGAM1661 gene, herein designated VGAM GENE, encodes a VGAM1661 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1661 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1661 precursor RNA is designated SEQ ID:1647, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1647 is located at position 100245 relative to the genome of Cercopithecine herpesvirus 7.

[23212] VGAM1661 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23213] An enzyme complex designated DICER COMPLEX, dices the VGAM1661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1661 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1661 RNA is designated SEQ ID:4372, and is provided hereinbelow with reference to the sequence listing part.

[23214] VGAM1661 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1661 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1661 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23215] VGAM1661 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1661 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1661 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1661 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1661 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23216] The complementary binding of VGAM1661 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1661 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1661 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1661 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23217] It is appreciated that VGAM1661 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1661 host target genes. The mRNA of each one of this plurality of VGAM1661 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1661 RNA, herein designated VGAM RNA, and which when bound by VGAM1661 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1661 host target proteins.

[23218] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1661 gene, herein designated VGAM GENE, on one or more VGAM1661 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23219] It is yet further appreciated that a function of VGAM1661 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1661 include diagnosis, prevention and

treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1661 correlate with, and may be deduced from, the identity of the host target genes which VGAM1661 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23220] Nucleotide sequences of the VGAM1661 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1661 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1661 are further described hereinbelow with reference to Table 1.

[23221] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1661 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23222] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1662 (VGAM1662) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23223] VGAM1662 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1662 was detected is described hereinabove with reference to Figs. 2-8.

[23224] VGAM1662 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1662 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23225] VGAM1662 gene, herein designated VGAM GENE, encodes a VGAM1662 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1662 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1662 precursor RNA is designated SEQ ID:1648, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1648 is located at position 99606 relative to the genome of Cercopithecine her-

pesvirus 7.

[23226] VGAM1662 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23227] An enzyme complex designated DICER COMPLEX, dices the VGAM1662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1662 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1662 RNA is designated SEQ ID:4373, and is provided hereinbelow with reference to the sequence listing part.

[23228] VGAM1662 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1662 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1662 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23229] VGAM1662 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1662 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1662 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1662 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1662 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23230] The complementary binding of VGAM1662 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1662 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1662 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1662 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23231] It is appreciated that VGAM1662 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1662 host target genes. The mRNA of each one of this plurality of VGAM1662 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1662 RNA, herein designated VGAM RNA, and which when bound by VGAM1662 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1662 host target proteins.

[23232] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1662 gene, herein designated VGAM GENE, on one or more VGAM1662 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23233] It is yet further appreciated that a function of VGAM1662 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1662 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1662 correlate with, and may be deduced from, the identity of the host target genes which VGAM1662 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23234] Nucleotide sequences of the VGAM1662 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1662 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1662 are further described hereinbelow with reference to Table 1.

[23235] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1662 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23236] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1663 (VGAM1663) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23237] VGAM1663 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1663 was detected is described hereinabove with reference to Figs. 2-8.

[23238] VGAM1663 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1663 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23239] VGAM1663 gene, herein designated VGAM GENE, encodes a VGAM1663 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1663 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1663 precursor RNA is designated SEQ ID:1649, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1649 is located at position 98907 relative to the genome of Cercopithecine herpesvirus 7.

[23240] VGAM1663 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23241] An enzyme complex designated DICER COMPLEX, dices the VGAM1663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1663 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1663 RNA is designated SEQ ID:4374, and

is provided hereinbelow with reference to the sequence listing part.

[23242] VGAM1663 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1663 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1663 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23243] VGAM1663 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1663 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1663 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1663 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1663 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23244] The complementary binding of VGAM1663 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1663 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1663 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1663 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23245] It is appreciated that VGAM1663 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1663 host target genes. The mRNA of each one of this plurality of VGAM1663 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1663 RNA, herein designated VGAM RNA, and which when bound by VGAM1663 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1663 host target proteins.

[23246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1663 gene, herein designated VGAM GENE, on one or more VGAM1663 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23247] It is yet further appreciated that a function of VGAM1663 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1663 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1663 correlate with, and may be deduced from, the identity of the host target genes which VGAM1663 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23248] Nucleotide sequences of the VGAM1663 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1663 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1663 are further described hereinbelow with reference to Table 1.

[23249] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1663 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23250] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1664 (VGAM1664) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23251] VGAM1664 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1664 was detected is described hereinabove with reference to Figs. 2-8.

[23252] VGAM1664 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1664 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23253] VGAM1664 gene, herein designated VGAM GENE, encodes a VGAM1664 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1664 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1664 precur-

sor RNA is designated SEQ ID:1650, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1650 is located at position 105330 relative to the genome of Cercopithecine herpesvirus 7.

[23254] VGAM1664 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23255] An enzyme complex designated DICER COMPLEX, dices the VGAM1664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1664 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1664 RNA is designated SEQ ID:4375, and is provided hereinbelow with reference to the sequence listing part.

[23256] VGAM1664 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1664 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1664 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23257] VGAM1664 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1664 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1664 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1664 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1664 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23258] The complementary binding of VGAM1664 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1664 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1664 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1664 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23259] It is appreciated that VGAM1664 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1664 host target genes. The mRNA of each one of this plurality of VGAM1664 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1664 RNA, herein designated VGAM RNA, and which when bound by VGAM1664 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1664 host target proteins.

[23260] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1664 gene, herein designated VGAM GENE, on one or more VGAM1664 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23261] It is yet further appreciated that a function of VGAM1664 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1664 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1664 correlate with, and may be deduced from, the identity of the host target genes which VGAM1664 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23262] Nucleotide sequences of the VGAM1664 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1664 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1664 are further described hereinbelow with reference to Table 1.

[23263] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1664 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23264] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1665 (VGAM1665) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23265] VGAM1665 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1665 was detected is described hereinabove with reference to Figs. 2-8.

[23266] VGAM1665 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM1665 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23267] VGAM1665 gene, herein designated VGAM GENE, encodes a VGAM1665 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1665 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1665 precursor RNA is designated SEQ ID:1651, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1651 is located at position 60134 relative to the genome of infectious spleen and kidney necrosis virus.

[23268] VGAM1665 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23269] An enzyme complex designated DICER COMPLEX, dices the VGAM1665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1665 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1665 RNA is designated SEQ ID:4376, and is provided hereinbelow with reference to the sequence listing part.

[23270] VGAM1665 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1665 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1665 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23271] VGAM1665 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1665 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1665 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1665 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1665 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23272] The complementary binding of VGAM1665 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1665 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1665 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1665 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23273] It is appreciated that VGAM1665 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1665 host target genes. The mRNA of each one of this plurality of VGAM1665 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1665 RNA, herein designated VGAM RNA, and which when bound by VGAM1665 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1665 host target proteins.

[23274] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1665 gene, herein designated VGAM GENE, on one or more VGAM1665 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23275] It is yet further appreciated that a function of VGAM1665 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1665 include diagnosis, prevention and treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM1665 correlate with, and may be deduced from, the identity of the host target genes which VGAM1665 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23276] Nucleotide sequences of the VGAM1665 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1665 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1665 are further described hereinbelow with reference to Table 1.

[23277] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1665 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23278] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1666 (VGAM1666) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23279] VGAM1666 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1666 was detected is described hereinabove with reference to Figs. 2-8.

[23280] VGAM1666 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM1666 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23281] VGAM1666 gene, herein designated VGAM GENE, encodes a VGAM1666 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1666 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1666 precursor RNA is designated SEQ ID:1652, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1652 is located at position 58471 relative to the genome of infectious spleen and kidney necrosis virus.

[23282] VGAM1666 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23283] An enzyme complex designated DICER COMPLEX, dices the VGAM1666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1666 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1666 RNA is designated SEQ ID:4377, and is provided hereinbelow with reference to the sequence listing part.

[23284] VGAM1666 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1666 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1666 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23285] VGAM1666 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1666 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1666 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1666 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1666 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23286] The complementary binding of VGAM1666 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1666 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1666 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1666 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23287] It is appreciated that VGAM1666 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1666 host target genes. The mRNA of each one of this plurality of VGAM1666 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1666 RNA, herein designated VGAM RNA, and which when bound by VGAM1666 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1666 host target proteins.

[23288] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1666 gene, herein designated VGAM GENE, on one or more VGAM1666 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23289] It is yet further appreciated that a function of VGAM1666 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1666 include diagnosis, prevention and treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM1666 correlate with, and may be deduced from, the identity of the host target genes which VGAM1666 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23290] Nucleotide sequences of the VGAM1666 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1666 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1666 are further described hereinbelow with reference to Table 1.

[23291] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1666 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23292] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1667 (VGAM1667) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23293] VGAM1667 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1667 was detected is described hereinabove with reference to Figs. 2-8.

[23294] VGAM1667 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM1667 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23295] VGAM1667 gene, herein designated VGAM GENE, encodes

a VGAM1667 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1667 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1667 precursor RNA is designated SEQ ID:1653, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1653 is located at position 52329 relative to the genome of infectious spleen and kidney necrosis virus.

[23296] VGAM1667 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23297] An enzyme complex designated DICER COMPLEX, dices the VGAM1667 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1667 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1667 RNA is designated SEQ ID:4378, and is provided hereinbelow with reference to the sequence listing part.

[23298] VGAM1667 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1667 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1667 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23299] VGAM1667 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1667 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1667 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1667 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1667 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23300] The complementary binding of VGAM1667 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1667 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1667

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1667 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23301] It is appreciated that VGAM1667 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1667 host target genes. The mRNA of each one of this plurality of VGAM1667 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1667 RNA, herein designated VGAM RNA, and which when bound by VGAM1667 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1667 host target proteins.

[23302] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1667 gene, herein designated VGAM GENE, on one or more VGAM1667 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23303] It is yet further appreciated that a function of VGAM1667 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1667 include diagnosis, prevention and treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM1667 correlate with, and may be deduced from, the identity of the host target genes which VGAM1667 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23304] Nucleotide sequences of the VGAM1667 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1667 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1667 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1667 are further described hereinbelow with reference to Table 1.

[23305] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1667 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23306] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1668 (VGAM1668) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23307] VGAM1668 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1668 was detected is described hereinabove with reference to Figs. 2-8.

[23308] VGAM1668 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus D. VGAM1668 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[23309] VGAM1668 gene, herein designated VGAM GENE, encodes a VGAM1668 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1668 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1668 precursor RNA is designated SEQ ID:1654, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1654 is located at position 20850 relative to the genome of Human adenovirus D.

[23310] VGAM1668 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23311] An enzyme complex designated DICER COMPLEX, dices

the VGAM1668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1668 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1668 RNA is designated SEQ ID:4379, and is provided hereinbelow with reference to the sequence listing part.

[23312] VGAM1668 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1668 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1668 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23313] VGAM1668 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1668 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1668 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1668 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1668 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23314] The complementary binding of VGAM1668 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1668 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1668 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1668 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23315] It is appreciated that VGAM1668 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1668 host target genes. The mRNA of each one of this plurality of VGAM1668 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1668 RNA, herein designated VGAM RNA, and which when bound by VGAM1668 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1668 host target proteins.

[23316] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1668 gene, herein designated VGAM GENE, on one or more VGAM1668 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23317] It is yet further appreciated that a function of VGAM1668 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1668 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM1668 correlate with, and may be deduced from, the identity of the host target genes which VGAM1668 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23318] Nucleotide sequences of the VGAM1668 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1668 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1668 are further described hereinbelow with reference to Table 1.

[23319] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1668 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23320] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1669 (VGAM1669) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23321] VGAM1669 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1669 was detected is described hereinabove with reference to Figs. 2-8.

[23322] VGAM1669 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus D. VGAM1669 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[23323] VGAM1669 gene, herein designated VGAM GENE, encodes a VGAM1669 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1669 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1669 precursor RNA is designated SEQ ID:1655, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1655 is located at position 18504 relative to the genome of Human adenovirus D.

[23324] VGAM1669 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23325] An enzyme complex designated DICER COMPLEX, dices the VGAM1669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1669 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1669 RNA is designated SEQ ID:4380, and is provided hereinbelow with reference to the sequence listing part.

[23326] VGAM1669 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1669 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1669 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23327] VGAM1669 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1669 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1669 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1669 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1669 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23328] The complementary binding of VGAM1669 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1669 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1669 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1669 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23329] It is appreciated that VGAM1669 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1669 host target genes. The mRNA of each one of this plurality of VGAM1669 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1669 RNA, herein designated VGAM RNA, and which when bound by VGAM1669 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1669 host target proteins.

[23330] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1669 gene, herein designated VGAM GENE, on one or more VGAM1669 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23331] It is yet further appreciated that a function of VGAM1669 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1669 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM1669 correlate with, and may be deduced from, the identity of the host target genes which VGAM1669 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23332] Nucleotide sequences of the VGAM1669 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1669 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1669 are further described hereinbelow with reference to Table 1.

[23333] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1669 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23334] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1670 (VGAM1670) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23335] VGAM1670 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1670 was detected is described hereinabove with reference to Figs. 2-8.

[23336] VGAM1670 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus D.

VGAM1670 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23337] VGAM1670 gene, herein designated VGAM GENE, encodes a VGAM1670 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1670 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1670 precursor RNA is designated SEQ ID:1656, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1656 is located at position 16692 relative to the genome of Human adenovirus D.

[23338] VGAM1670 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[23339] An enzyme complex designated DICER COMPLEX, dices the VGAM1670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1670 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1670 RNA is designated SEQ ID:4381, and is provided hereinbelow with reference to the sequence listing part.

[23340] VGAM1670 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1670 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1670 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23341] VGAM1670 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1670 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1670 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1670 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1670 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23342] The complementary binding of VGAM1670 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1670 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1670 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1670 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23343] It is appreciated that VGAM1670 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1670 host target genes. The mRNA of each one of this plurality of VGAM1670 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1670 RNA, herein designated VGAM RNA, and which when bound by VGAM1670 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1670 host target proteins.

[23344] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1670 gene, herein designated VGAM GENE, on one or more VGAM1670 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23345] It is yet further appreciated that a function of VGAM1670 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1670 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM1670 correlate with, and may be deduced from, the identity of the host target genes which VGAM1670 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23346] Nucleotide sequences of the VGAM1670 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1670 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1670 are further described hereinbelow with reference to Table 1.

[23347] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1670 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23348] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1671 (VGAM1671) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23349] VGAM1671 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1671 was detected is described hereinabove with reference to Figs. 2-8.

[23350] VGAM1671 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human adenovirus D. VGAM1671 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23351] VGAM1671 gene, herein designated VGAM GENE, encodes a VGAM1671 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1671 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1671 precursor RNA is designated SEQ ID:1657, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1657 is located at position 13911 relative to the genome of Human adenovirus D.

[23352] VGAM1671 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23353] An enzyme complex designated DICER COMPLEX, dices the VGAM1671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1671 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1671 RNA is designated SEQ ID:4382, and is provided hereinbelow with reference to the sequence listing part.

[23354] VGAM1671 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1671 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1671 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23355] VGAM1671 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1671 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1671 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1671 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1671 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23356] The complementary binding of VGAM1671 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1671 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1671 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1671 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23357] It is appreciated that VGAM1671 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1671 host target genes. The mRNA of each one of this plurality of VGAM1671 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1671 RNA, herein designated VGAM RNA, and which when bound by VGAM1671 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1671 host target proteins.

[23358] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1671 gene, herein designated VGAM GENE, on one or more VGAM1671 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23359] It is yet further appreciated that a function of VGAM1671 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1671 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM1671 correlate with, and may be deduced from, the identity of the host target genes which VGAM1671 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23360] Nucleotide sequences of the VGAM1671 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1671 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1671 are further described hereinbelow with reference to Table 1.

[23361] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1671 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23362] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1672 (VGAM1672) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23363] VGAM1672 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1672 was detected is described hereinabove with reference to Figs. 2-8.

[23364] VGAM1672 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne encephalitis virus. VGAM1672 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23365] VGAM1672 gene, herein designated VGAM GENE, encodes a VGAM1672 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1672 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1672 precursor RNA is designated SEQ ID:1658, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1658 is located at position 9955 relative to the genome of Tick-borne encephalitis virus.

[23366] VGAM1672 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23367] An enzyme complex designated DICER COMPLEX, dices the VGAM1672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1672 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM1672 RNA is designated SEQ ID:4383, and is provided hereinbelow with reference to the sequence listing part.

[23368] VGAM1672 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1672 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1672 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[23369] VGAM1672 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1672 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1672 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1672 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1672 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23370] The complementary binding of VGAM1672 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1672 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1672 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1672 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23371] It is appreciated that VGAM1672 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1672 host target genes. The mRNA of each one of this plurality of VGAM1672 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1672 RNA, herein designated VGAM RNA, and which when bound by VGAM1672 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1672 host target proteins.

[23372] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1672 gene, herein designated VGAM GENE, on one

or more VGAM1672 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23373] It is yet further appreciated that a function of VGAM1672 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1672 include diagnosis, prevention and treatment of viral infection by Tick-borne encephalitis virus. Specific functions, and accordingly utilities, of VGAM1672 correlate with, and may be deduced from, the identity of the host target genes which VGAM1672 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23374] Nucleotide sequences of the VGAM1672 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1672 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1672 are further described hereinbelow with reference to Table 1.

[23375] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1672 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23376] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1673 (VGAM1673) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23377] VGAM1673 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1673 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[23378] VGAM1673 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne encephalitis virus. VGAM1673 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23379] VGAM1673 gene, herein designated VGAM GENE, encodes a VGAM1673 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1673 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1673 precursor RNA is designated SEQ ID:1659, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1659 is located at position 6145 relative to the genome of Tick-borne encephalitis virus.

[23380] VGAM1673 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23381] An enzyme complex designated DICER COMPLEX, dices the VGAM1673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1673 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1673 RNA is designated SEQ ID:4384, and is provided hereinbelow with reference to the sequence listing part.

[23382] VGAM1673 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1673 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1673 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23383] VGAM1673 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1673 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1673 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1673 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1673 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[23384] The complementary binding of VGAM1673 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1673 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1673 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1673 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23385] It is appreciated that VGAM1673 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1673 host target genes. The mRNA of each one of this plurality of VGAM1673 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1673 RNA, herein designated VGAM RNA, and which when bound by VGAM1673 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1673 host target proteins.

[23386] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1673 gene, herein designated VGAM GENE, on one or more VGAM1673 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23387] It is yet further appreciated that a function of VGAM1673 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1673 include diagnosis, prevention and treatment of viral infection by Tick-borne encephalitis virus. Specific functions, and accordingly utilities, of VGAM1673 correlate with, and may be deduced from, the identity of the host target genes which VGAM1673 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[23388] Nucleotide sequences of the VGAM1673 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1673 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1673 are further described hereinbelow with reference to Table 1.

[23389] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1673 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23390] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1674 (VGAM1674) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23391] VGAM1674 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1674 was detected is described hereinabove with reference to Figs. 2-8.

[23392] VGAM1674 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne encephalitis virus. VGAM1674 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23393] VGAM1674 gene, herein designated VGAM GENE, encodes a VGAM1674 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1674 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1674 precursor RNA is designated SEQ ID:1660, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1660 is located at position 4389 relative to the genome of Tick-borne encephalitis virus.

[23394] VGAM1674 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23395] An enzyme complex designated DICER COMPLEX, dices the VGAM1674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1674 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1674 RNA is designated SEQ ID:4385, and is provided hereinbelow with reference to the sequence listing part.

[23396] VGAM1674 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1674 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1674 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23397] VGAM1674 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1674 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1674 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1674 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1674 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23398] The complementary binding of VGAM1674 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1674 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1674 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1674 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23399] It is appreciated that VGAM1674 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1674 host target genes. The mRNA of each one of this plurality of VGAM1674 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1674 RNA, herein designated VGAM RNA, and which when bound by VGAM1674 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1674 host target proteins.

[23400] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1674 gene, herein designated VGAM GENE, on one or more VGAM1674 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23401] It is yet further appreciated that a function of VGAM1674 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1674 include diagnosis, prevention and treatment of viral infection by Tick-borne encephalitis virus. Specific functions, and accordingly utilities, of VGAM1674 correlate with, and may be deduced from, the identity of the host target genes which VGAM1674 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23402] Nucleotide sequences of the VGAM1674 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1674 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1674 are further described hereinbelow with reference to Table 1.

[23403] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1674 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23404] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1675 (VGAM1675) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23405] VGAM1675 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1675 was detected is described hereinabove with reference to Figs. 2-8.

[23406] VGAM1675 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral hemorrhagic septicemia virus. VGAM1675 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23407] VGAM1675 gene, herein designated VGAM GENE, encodes a VGAM1675 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1675 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1675 precursor RNA is designated SEQ ID:1661, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1661 is located at position 1531 relative to the genome of Viral hemorrhagic septicemia virus.

[23408] VGAM1675 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1675 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23409] An enzyme complex designated DICER COMPLEX, dices the VGAM1675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1675 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1675 RNA is designated SEQ ID:4386, and is provided hereinbelow with reference to the sequence listing part.

[23410] VGAM1675 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1675 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1675 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23411] VGAM1675 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1675 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1675 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1675 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1675 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23412] The complementary binding of VGAM1675 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1675 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1675 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1675 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23413] It is appreciated that VGAM1675 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1675 host target genes. The mRNA of each one of this plurality of VGAM1675 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1675 RNA, herein designated VGAM RNA, and which when bound by VGAM1675 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1675 host target proteins.

[23414] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1675 gene, herein designated VGAM GENE, on one or more VGAM1675 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23415] It is yet further appreciated that a function of VGAM1675 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1675 include diagnosis, prevention and treatment of viral infection by Viral hemorrhagic septicemia virus. Specific functions, and accordingly utilities,

of VGAM1675 correlate with, and may be deduced from, the identity of the host target genes which VGAM1675 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23416] Nucleotide sequences of the VGAM1675 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1675 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1675 are further described hereinbelow with reference to Table 1.

[23417] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1675 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23418] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1676 (VGAM1676) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[23419] VGAM1676 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1676 was detected is described hereinabove with reference to Figs. 2-8.

[23420] VGAM1676 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral hemorrhagic septicemia virus. VGAM1676 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23421] VGAM1676 gene, herein designated VGAM GENE, encodes a VGAM1676 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1676 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1676 precursor RNA is designated SEQ ID:1662, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1662 is located at position 7506 relative to the genome of Viral hemorrhagic septicemia virus.

[23422] VGAM1676 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23423] An enzyme complex designated DICER COMPLEX, dices the VGAM1676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1676 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1676 RNA is designated SEQ ID:4387, and is provided hereinbelow with reference to the sequence listing part.

[23424] VGAM1676 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1676 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1676 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23425] VGAM1676 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1676 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1676 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1676 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1676 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23426] The complementary binding of VGAM1676 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1676 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1676 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1676 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23427] It is appreciated that VGAM1676 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1676 host target genes. The mRNA of each one of this plurality of VGAM1676 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1676 RNA, herein designated VGAM RNA, and which when bound by VGAM1676 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1676 host target proteins.

[23428] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1676 gene, herein designated VGAM GENE, on one or more VGAM1676 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23429] It is yet further appreciated that a function of VGAM1676 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1676 include diagnosis, prevention and

treatment of viral infection by Viral hemorrhagic septicemia virus. Specific functions, and accordingly utilities, of VGAM1676 correlate with, and may be deduced from, the identity of the host target genes which VGAM1676 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23430] Nucleotide sequences of the VGAM1676 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1676 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1676 are further described hereinbelow with reference to Table 1.

[23431] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1676 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23432] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1677 (VGAM1677) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23433] VGAM1677 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1677 was detected is described hereinabove with reference to Figs. 2-8.

[23434] VGAM1677 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral hemorrhagic septicemia virus. VGAM1677 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23435] VGAM1677 gene, herein designated VGAM GENE, encodes a VGAM1677 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1677 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1677 precursor RNA is designated SEQ ID:1663, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1663 is located at position 5586 relative to the genome of Viral hemorrhagic septicemia

virus.

[23436] VGAM1677 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23437] An enzyme complex designated DICER COMPLEX, dices the VGAM1677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1677 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1677 RNA is designated SEQ ID:4388, and is provided hereinbelow with reference to the sequence listing part.

[23438] VGAM1677 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1677 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1677 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23439] VGAM1677 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1677 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1677 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1677 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1677 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23440] The complementary binding of VGAM1677 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1677 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1677 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1677 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23441] It is appreciated that VGAM1677 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1677 host target genes. The mRNA of each one of this plurality of VGAM1677 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1677 RNA, herein designated VGAM RNA, and which when bound by VGAM1677 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1677 host target proteins.

[23442] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1677 gene, herein designated VGAM GENE, on one or more VGAM1677 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23443] It is yet further appreciated that a function of VGAM1677 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1677 include diagnosis, prevention and treatment of viral infection by Viral hemorrhagic septicemia virus. Specific functions, and accordingly utilities, of VGAM1677 correlate with, and may be deduced from, the identity of the host target genes which VGAM1677 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23444] Nucleotide sequences of the VGAM1677 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1677 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1677 are further described hereinbelow with reference to Table 1.

[23445] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1677 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23446] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1678 (VGAM1678) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23447] VGAM1678 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1678 was detected is described hereinabove with reference to Figs. 2-8.

[23448] VGAM1678 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral hemorrhagic septicemia virus. VGAM1678 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23449] VGAM1678 gene, herein designated VGAM GENE, encodes a VGAM1678 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1678 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1678 precursor RNA is designated SEQ ID:1664, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1664 is located at position 10783 relative to the genome of Viral hemorrhagic septicemia virus.

[23450] VGAM1678 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23451] An enzyme complex designated DICER COMPLEX, dices the VGAM1678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1678 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM1678 RNA is designated SEQ ID:4389, and

is provided hereinbelow with reference to the sequence listing part.

[23452] VGAM1678 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1678 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1678 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23453] VGAM1678 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1678 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1678 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1678 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1678 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23454] The complementary binding of VGAM1678 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1678 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1678 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1678 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23455] It is appreciated that VGAM1678 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1678 host target genes. The mRNA of each one of this plurality of VGAM1678 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1678 RNA, herein designated VGAM RNA, and which when bound by VGAM1678 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1678 host target proteins.

[23456] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1678 gene, herein designated VGAM GENE, on one or more VGAM1678 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23457] It is yet further appreciated that a function of VGAM1678 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1678 include diagnosis, prevention and treatment of viral infection by Viral hemorrhagic septicemia virus. Specific functions, and accordingly utilities,

of VGAM1678 correlate with, and may be deduced from, the identity of the host target genes which VGAM1678 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23458] Nucleotide sequences of the VGAM1678 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1678 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1678 are further described hereinbelow with reference to Table 1.

[23459] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1678 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23460] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1679 (VGAM1679) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[23461] VGAM1679 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1679 was detected is described hereinabove with reference to Figs. 2-8.

[23462] VGAM1679 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral hemorrhagic septicemia virus. VGAM1679 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23463] VGAM1679 gene, herein designated VGAM GENE, encodes a VGAM1679 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1679 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1679 precursor RNA is designated SEQ ID:1665, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1665 is located at position 1372 relative to the genome of Viral hemorrhagic septicemia virus.

[23464] VGAM1679 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23465] An enzyme complex designated DICER COMPLEX, dices the VGAM1679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1679 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1679 RNA is designated SEQ ID:4390, and is provided hereinbelow with reference to the sequence listing part.

[23466] VGAM1679 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1679 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1679 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23467] VGAM1679 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1679 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1679 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1679 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1679 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23468] The complementary binding of VGAM1679 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1679 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1679 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1679 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23469] It is appreciated that VGAM1679 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1679 host target genes. The mRNA of each one of this plurality of VGAM1679 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1679 RNA, herein designated VGAM RNA, and which when bound by VGAM1679 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1679 host target proteins.

[23470] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1679 gene, herein designated VGAM GENE, on one or more VGAM1679 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23471] It is yet further appreciated that a function of VGAM1679 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1679 include diagnosis, prevention and

treatment of viral infection by Viral hemorrhagic septicemia virus. Specific functions, and accordingly utilities, of VGAM1679 correlate with, and may be deduced from, the identity of the host target genes which VGAM1679 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23472] Nucleotide sequences of the VGAM1679 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1679 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1679 are further described hereinbelow with reference to Table 1.

[23473] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1679 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23474] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1680 (VGAM1680) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23475] VGAM1680 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1680 was detected is described hereinabove with reference to Figs. 2-8.

[23476] VGAM1680 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Viral hemorrhagic septicemia virus. VGAM1680 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23477] VGAM1680 gene, herein designated VGAM GENE, encodes a VGAM1680 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1680 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1680 precursor RNA is designated SEQ ID:1666, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1666 is located at position 10244 relative to the genome of Viral hemorrhagic sep-

ticemia virus.

[23478] VGAM1680 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23479] An enzyme complex designated DICER COMPLEX, dices the VGAM1680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1680 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1680 RNA is designated SEQ ID:4391, and is provided hereinbelow with reference to the sequence listing part.

[23480] VGAM1680 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1680 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1680 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23481] VGAM1680 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1680 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1680 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1680 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1680 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23482] The complementary binding of VGAM1680 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1680 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1680 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1680 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23483] It is appreciated that VGAM1680 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1680 host target genes. The mRNA of each one of this plurality of VGAM1680 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1680 RNA, herein designated VGAM RNA, and which when bound by VGAM1680 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1680 host target proteins.

[23484] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1680 gene, herein designated VGAM GENE, on one or more VGAM1680 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23485] It is yet further appreciated that a function of VGAM1680 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1680 include diagnosis, prevention and treatment of viral infection by Viral hemorrhagic septicemia virus. Specific functions, and accordingly utilities, of VGAM1680 correlate with, and may be deduced from, the identity of the host target genes which VGAM1680 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23486] Nucleotide sequences of the VGAM1680 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1680 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1680 are further described hereinbelow with reference to Table 1.

[23487] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1680 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23488] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1681 (VGAM1681) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23489] VGAM1681 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1681 was detected is described hereinabove with reference to Figs. 2-8.

[23490] VGAM1681 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vesicular stomatitis Indiana virus. VGAM1681 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23491] VGAM1681 gene, herein designated VGAM GENE, encodes a VGAM1681 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1681 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1681 precursor RNA is designated SEQ ID:1667, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1667 is located at position 3549 relative to the genome of Vesicular stomatitis Indiana virus.

[23492] VGAM1681 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23493] An enzyme complex designated DICER COMPLEX, dices the VGAM1681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1681 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1681 RNA is designated SEQ ID:4392, and

is provided hereinbelow with reference to the sequence listing part.

[23494] VGAM1681 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1681 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1681 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23495] VGAM1681 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1681 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1681 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1681 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1681 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23496] The complementary binding of VGAM1681 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1681 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1681 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1681 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23497] It is appreciated that VGAM1681 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1681 host target genes. The mRNA of each one of this plurality of VGAM1681 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1681 RNA, herein designated VGAM RNA, and which when bound by VGAM1681 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1681 host target proteins.

[23498] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1681 gene, herein designated VGAM GENE, on one or more VGAM1681 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23499] It is yet further appreciated that a function of VGAM1681 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1681 include diagnosis, prevention and treatment of viral infection by Vesicular stomatitis Indiana virus. Specific functions, and accordingly utilities, of VGAM1681 correlate with, and may be deduced from, the identity of the host target genes which VGAM1681 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23500] Nucleotide sequences of the VGAM1681 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1681 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1681 are further described hereinbelow with reference to Table 1.

[23501] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1681 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23502] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1682 (VGAM1682) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23503] VGAM1682 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1682 was detected is described hereinabove with reference to Figs. 2-8.

[23504] VGAM1682 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vesicular stomatitis Indiana virus. VGAM1682 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23505] VGAM1682 gene, herein designated VGAM GENE, encodes a VGAM1682 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1682 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1682 precur-

sor RNA is designated SEQ ID:1668, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1668 is located at position 10245 relative to the genome of Vesicular stomatitis Indiana virus.

[23506] VGAM1682 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23507] An enzyme complex designated DICER COMPLEX, dices the VGAM1682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1682 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1682 RNA is designated SEQ ID:4393, and is provided hereinbelow with reference to the sequence listing part.

[23508] VGAM1682 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1682 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1682 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23509] VGAM1682 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1682 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1682 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1682 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1682 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23510] The complementary binding of VGAM1682 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1682 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1682 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1682 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23511] It is appreciated that VGAM1682 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1682 host target genes. The mRNA of each one of this plurality of VGAM1682 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1682 RNA, herein designated VGAM RNA, and which when bound by VGAM1682 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1682 host target proteins.

[23512] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1682 gene, herein designated VGAM GENE, on one or more VGAM1682 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23513] It is yet further appreciated that a function of VGAM1682 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1682 include diagnosis, prevention and treatment of viral infection by Vesicular stomatitis Indiana virus. Specific functions, and accordingly utilities, of VGAM1682 correlate with, and may be deduced from, the identity of the host target genes which VGAM1682 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23514] Nucleotide sequences of the VGAM1682 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1682 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1682 are further described hereinbelow with reference to Table 1.

[23515] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1682 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23516] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1683 (VGAM1683) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23517] VGAM1683 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1683 was detected is described hereinabove with reference to Figs. 2-8.

[23518] VGAM1683 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vesicular stomatitis Indiana virus. VGAM1683 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23519] VGAM1683 gene, herein designated VGAM GENE, encodes a VGAM1683 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1683 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1683 precursor RNA is designated SEQ ID:1669, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1669 is located at position 8817 relative to the genome of Vesicular stomatitis Indiana virus.

[23520] VGAM1683 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23521] An enzyme complex designated DICER COMPLEX, dices the VGAM1683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1683 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1683 RNA is designated SEQ ID:4394, and is provided hereinbelow with reference to the sequence listing part.

[23522] VGAM1683 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1683 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1683 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23523] VGAM1683 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1683 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1683 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1683 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1683 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23524] The complementary binding of VGAM1683 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1683 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1683 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1683 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23525] It is appreciated that VGAM1683 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1683 host target genes. The mRNA of each one of this plurality of VGAM1683 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1683 RNA, herein designated VGAM RNA, and which when bound by VGAM1683 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1683 host target proteins.

[23526] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1683 gene, herein designated VGAM GENE, on one or more VGAM1683 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23527] It is yet further appreciated that a function of VGAM1683 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1683 include diagnosis, prevention and treatment of viral infection by Vesicular stomatitis Indiana virus. Specific functions, and accordingly utilities, of VGAM1683 correlate with, and may be deduced from, the identity of the host target genes which VGAM1683 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23528] Nucleotide sequences of the VGAM1683 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1683 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1683 are further described hereinbelow with reference to Table 1.

[23529] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1683 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23530] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1684 (VGAM1684) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23531] VGAM1684 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1684 was detected is described hereinabove with reference to Figs. 2-8.

[23532] VGAM1684 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vesicular stomatitis Indiana virus. VGAM1684 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23533] VGAM1684 gene, herein designated VGAM GENE, encodes a VGAM1684 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1684 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1684 precursor RNA is designated SEQ ID:1670, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1670 is located at position 5581 relative to the genome of Vesicular stomatitis Indiana virus.

[23534] VGAM1684 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23535] An enzyme complex designated DICER COMPLEX, dices the VGAM1684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1684 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM1684 RNA is designated SEQ ID:4395, and is provided hereinbelow with reference to the sequence listing part.

[23536] VGAM1684 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1684 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1684 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23537] VGAM1684 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1684 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1684 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1684 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1684 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23538] The complementary binding of VGAM1684 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1684 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1684 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1684 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23539] It is appreciated that VGAM1684 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1684 host target genes. The mRNA of each one of this plurality of VGAM1684 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1684 RNA, herein designated VGAM RNA, and which when bound by VGAM1684 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1684 host target proteins.

[23540] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1684 gene, herein designated VGAM GENE, on one or more VGAM1684 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23541] It is yet further appreciated that a function of VGAM1684 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1684 include diagnosis, prevention and treatment of viral infection by Vesicular stomatitis Indiana virus. Specific functions, and accordingly utilities, of VGAM1684 correlate with, and may be deduced from, the identity of the host target genes which VGAM1684 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23542] Nucleotide sequences of the VGAM1684 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1684 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1684 are further described hereinbelow with reference to Table 1.

[23543] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1684 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23544] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1685 (VGAM1685) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23545] VGAM1685 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1685 was detected is described hereinabove with reference to Figs. 2-8.

[23546] VGAM1685 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vesicular stomatitis Indiana virus. VGAM1685 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23547] VGAM1685 gene, herein designated VGAM GENE, encodes

a VGAM1685 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1685 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1685 precursor RNA is designated SEQ ID:1671, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1671 is located at position 4965 relative to the genome of Vesicular stomatitis Indiana virus.

[23548] VGAM1685 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23549] An enzyme complex designated DICER COMPLEX, dices the VGAM1685 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1685 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1685 RNA is designated SEQ ID:4396, and is provided hereinbelow with reference to the sequence listing part.

[23550] VGAM1685 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1685 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1685 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23551] VGAM1685 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1685 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1685 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1685 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1685 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23552] The complementary binding of VGAM1685 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1685 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1685

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1685 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23553] It is appreciated that VGAM1685 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1685 host target genes. The mRNA of each one of this plurality of VGAM1685 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1685 RNA, herein designated VGAM RNA, and which when bound by VGAM1685 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1685 host target proteins.

[23554] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1685 gene, herein designated VGAM GENE, on one or more VGAM1685 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23555] It is yet further appreciated that a function of VGAM1685 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1685 include diagnosis, prevention and treatment of viral infection by Vesicular stomatitis Indiana virus. Specific functions, and accordingly utilities, of VGAM1685 correlate with, and may be deduced from, the identity of the host target genes which VGAM1685 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23556] Nucleotide sequences of the VGAM1685 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1685 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1685 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1685 are further described hereinbelow with reference to Table 1.

[23557] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1685 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23558] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1686 (VGAM1686) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23559] VGAM1686 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1686 was detected is described hereinabove with reference to Figs. 2-8.

[23560] VGAM1686 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vesicular stomatitis Indiana virus. VGAM1686 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[23561] VGAM1686 gene, herein designated VGAM GENE, encodes a VGAM1686 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1686 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1686 precursor RNA is designated SEQ ID:1672, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1672 is located at position 2116 relative to the genome of Vesicular stomatitis Indiana virus.

[23562] VGAM1686 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23563] An enzyme complex designated DICER COMPLEX, dices the VGAM1686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1686 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1686 RNA is designated SEQ ID:4397, and is provided hereinbelow with reference to the sequence listing part.

[23564] VGAM1686 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1686 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1686 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23565] VGAM1686 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1686 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1686 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1686 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1686 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23566] The complementary binding of VGAM1686 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1686 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1686 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1686 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23567] It is appreciated that VGAM1686 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1686 host target genes. The mRNA of each one of this plurality of VGAM1686 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1686 RNA, herein designated VGAM RNA, and which when bound by VGAM1686 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1686 host target proteins.

[23568] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1686 gene, herein designated VGAM GENE, on one or more VGAM1686 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23569] It is yet further appreciated that a function of VGAM1686 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1686 include diagnosis, prevention and treatment of viral infection by Vesicular stomatitis Indiana virus. Specific functions, and accordingly utilities, of VGAM1686 correlate with, and may be deduced from, the identity of the host target genes which VGAM1686 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23570] Nucleotide sequences of the VGAM1686 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1686 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1686 are further described hereinbelow with reference to Table 1.

[23571] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1686 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23572] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1687 (VGAM1687) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23573] VGAM1687 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1687 was detected is described hereinabove with reference to Figs. 2-8.

[23574] VGAM1687 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cy-

tomegalovirus. VGAM1687 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23575] VGAM1687 gene, herein designated VGAM GENE, encodes a VGAM1687 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1687 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1687 precursor RNA is designated SEQ ID:1673, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1673 is located at position 126333 relative to the genome of Chimpanzee cytomegalovirus.

[23576] VGAM1687 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23577] An enzyme complex designated DICER COMPLEX, dices the VGAM1687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1687 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1687 RNA is designated SEQ ID:4398, and is provided hereinbelow with reference to the sequence listing part.

[23578] VGAM1687 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1687 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1687 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23579] VGAM1687 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1687 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1687 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1687 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1687 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23580] The complementary binding of VGAM1687 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1687 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1687 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1687 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23581] It is appreciated that VGAM1687 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1687 host target genes. The mRNA of each one of this plurality of VGAM1687 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1687 RNA, herein designated VGAM RNA, and which when bound by VGAM1687 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1687 host target proteins.

[23582] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1687 gene, herein designated VGAM GENE, on one or more VGAM1687 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23583] It is yet further appreciated that a function of VGAM1687 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1687 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1687 correlate with, and may be deduced from, the identity of the host target genes which VGAM1687 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23584] Nucleotide sequences of the VGAM1687 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1687 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1687 are further described hereinbelow with reference to Table 1.

[23585] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1687 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23586] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1688 (VGAM1688) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23587] VGAM1688 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1688 was detected is described hereinabove with reference to Figs. 2-8.

[23588] VGAM1688 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1688 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23589] VGAM1688 gene, herein designated VGAM GENE, encodes a VGAM1688 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1688 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1688 precursor RNA is designated SEQ ID:1674, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1674 is located at position 123345 relative to the genome of Chimpanzee cytomegalovirus.

[23590] VGAM1688 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23591] An enzyme complex designated DICER COMPLEX, dices the VGAM1688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1688 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1688 RNA is designated SEQ ID:4399, and is provided hereinbelow with reference to the sequence listing part.

[23592] VGAM1688 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1688 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1688 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23593] VGAM1688 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1688 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1688 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1688 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1688 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[23594] The complementary binding of VGAM1688 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1688 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1688 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1688 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23595] It is appreciated that VGAM1688 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1688 host target genes. The mRNA of each one of this plurality of VGAM1688 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1688 RNA, herein designated VGAM RNA, and which when bound by VGAM1688 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1688 host target proteins.

[23596] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1688 gene, herein designated VGAM GENE, on one or more VGAM1688 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23597] It is yet further appreciated that a function of VGAM1688 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1688 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1688 correlate with, and may be deduced from, the identity of the host target genes which VGAM1688 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[23598] Nucleotide sequences of the VGAM1688 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1688 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1688 are further described hereinbelow with reference to Table 1.

[23599] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1688 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23600] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1689 (VGAM1689) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23601] VGAM1689 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1689 was detected is described hereinabove with reference to Figs. 2-8.

[23602] VGAM1689 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1689 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23603] VGAM1689 gene, herein designated VGAM GENE, encodes a VGAM1689 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1689 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1689 precursor RNA is designated SEQ ID:1675, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1675 is located at position 127857 relative to the genome of Chimpanzee cytomegalovirus.

[23604] VGAM1689 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23605] An enzyme complex designated DICER COMPLEX, dices the VGAM1689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1689 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1689 RNA is designated SEQ ID:4400, and is provided hereinbelow with reference to the sequence listing part.

[23606] VGAM1689 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1689 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1689 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23607] VGAM1689 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1689 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1689 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1689 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1689 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23608] The complementary binding of VGAM1689 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1689 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1689 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1689 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23609] It is appreciated that VGAM1689 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1689 host target genes. The mRNA of each one of this plurality of VGAM1689 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1689 RNA, herein designated VGAM RNA, and which when bound by VGAM1689 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1689 host target proteins.

[23610] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1689 gene, herein designated VGAM GENE, on one or more VGAM1689 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23611] It is yet further appreciated that a function of VGAM1689 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1689 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1689 correlate with, and may be deduced

from, the identity of the host target genes which VGAM1689 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23612] Nucleotide sequences of the VGAM1689 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1689 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1689 are further described hereinbelow with reference to Table 1.

[23613] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1689 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23614] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1690 (VGAM1690) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23615] VGAM1690 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1690 was detected is described hereinabove with reference to Figs. 2-8.

[23616] VGAM1690 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1690 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23617] VGAM1690 gene, herein designated VGAM GENE, encodes a VGAM1690 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1690 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1690 precursor RNA is designated SEQ ID:1676, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1676 is located at position 49102 relative to the genome of Ectocarpus siliculosus virus.

[23618] VGAM1690 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1690 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23619] An enzyme complex designated DICER COMPLEX, dices the VGAM1690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1690 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1690 RNA is designated SEQ ID:4401, and is provided hereinbelow with reference to the sequence listing part.

[23620] VGAM1690 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1690 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1690 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23621] VGAM1690 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1690 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1690 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1690 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1690 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23622] The complementary binding of VGAM1690 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1690 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1690 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1690 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23623] It is appreciated that VGAM1690 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1690 host target genes. The mRNA of each one of this plurality of VGAM1690 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1690 RNA, herein designated VGAM RNA, and which when bound by VGAM1690 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1690 host target proteins.

[23624] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1690 gene, herein designated VGAM GENE, on one or more VGAM1690 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23625] It is yet further appreciated that a function of VGAM1690 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1690 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus.

Specific functions, and accordingly utilities, of VGAM1690 correlate with, and may be deduced from, the identity of the host target genes which VGAM1690 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23626] Nucleotide sequences of the VGAM1690 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1690 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1690 are further described hereinbelow with reference to Table 1.

[23627] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1690 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23628] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1691 (VGAM1691) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[23629] VGAM1691 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1691 was detected is described hereinabove with reference to Figs. 2-8.

[23630] VGAM1691 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1691 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23631] VGAM1691 gene, herein designated VGAM GENE, encodes a VGAM1691 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1691 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1691 precursor RNA is designated SEQ ID:1677, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1677 is located at position 46991 relative to the genome of Ectocarpus siliculosus virus.

[23632] VGAM1691 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23633] An enzyme complex designated DICER COMPLEX, dices the VGAM1691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1691 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1691 RNA is designated SEQ ID:4402, and is provided hereinbelow with reference to the sequence listing part.

[23634] VGAM1691 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1691 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1691 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23635] VGAM1691 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1691 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1691 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1691 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1691 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23636] The complementary binding of VGAM1691 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1691 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1691 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1691 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23637] It is appreciated that VGAM1691 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1691 host target genes. The mRNA of each one of this plurality of VGAM1691 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1691 RNA, herein designated VGAM

RNA, and which when bound by VGAM1691 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1691 host target proteins.

[23638] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1691 gene, herein designated VGAM GENE, on one or more VGAM1691 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23639] It is yet further appreciated that a function of VGAM1691 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1691 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1691 correlate with, and may be deduced from, the identity of the host target genes which VGAM1691 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23640] Nucleotide sequences of the VGAM1691 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1691 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1691 are further described hereinbelow with reference to Table 1.

[23641] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1691 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23642] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1692 (VGAM1692) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23643] VGAM1692 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1692 was detected is described hereinabove with reference to Figs. 2-8.

[23644] VGAM1692 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1692 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23645] VGAM1692 gene, herein designated VGAM GENE, encodes a VGAM1692 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1692 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1692 precursor RNA is designated SEQ ID:1678, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1678 is located at position

52063 relative to the genome of Ectocarpus siliculosus virus.

[23646] VGAM1692 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23647] An enzyme complex designated DICER COMPLEX, dices the VGAM1692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1692 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1692 RNA is designated SEQ ID:4403, and is provided hereinbelow with reference to the sequence

listing part.

[23648] VGAM1692 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1692 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1692 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23649] VGAM1692 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1692 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1692 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1692 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1692 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23650] The complementary binding of VGAM1692 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1692 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1692 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1692 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23651] It is appreciated that VGAM1692 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1692 host target genes. The mRNA of each one of this plurality of VGAM1692 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1692 RNA, herein designated VGAM RNA, and which when bound by VGAM1692 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1692 host target proteins.

[23652] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1692 gene, herein designated VGAM GENE, on one or more VGAM1692 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23653] It is yet further appreciated that a function of VGAM1692

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1692 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1692 correlate with, and may be deduced from, the identity of the host target genes which VGAM1692 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23654] Nucleotide sequences of the VGAM1692 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1692 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1692 are further described hereinbelow with reference to Table 1.

[23655] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1692 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23656] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1693 (VGAM1693) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23657] VGAM1693 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1693 was detected is described hereinabove with reference to Figs. 2-8.

[23658] VGAM1693 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1693 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23659] VGAM1693 gene, herein designated VGAM GENE, encodes a VGAM1693 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1693 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1693 precursor RNA is designated SEQ ID:1679, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1679 is located at position 54673 relative to the genome of Ectocarpus siliculosus virus.

[23660] VGAM1693 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23661] An enzyme complex designated DICER COMPLEX, dices the VGAM1693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1693 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM1693 RNA is designated SEQ ID:4404, and is provided hereinbelow with reference to the sequence listing part.

[23662] VGAM1693 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1693 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1693 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23663] VGAM1693 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1693 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1693 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1693 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1693 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23664] The complementary binding of VGAM1693 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1693 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1693 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1693 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23665] It is appreciated that VGAM1693 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1693 host target genes. The mRNA of

each one of this plurality of VGAM1693 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1693 RNA, herein designated VGAM RNA, and which when bound by VGAM1693 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1693 host target proteins.

[23666] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1693 gene, herein designated VGAM GENE, on one or more VGAM1693 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[23667] It is yet further appreciated that a function of VGAM1693 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1693 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1693 correlate with, and may be deduced from, the identity of the host target genes which VGAM1693 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23668] Nucleotide sequences of the VGAM1693 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1693 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1693 are further described hereinbelow with reference to Table 1.

[23669] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1693 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[23670] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1694 (VGAM1694) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23671] VGAM1694 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1694 was detected is described hereinabove with reference to Figs. 2-8.

[23672] VGAM1694 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1694 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23673] VGAM1694 gene, herein designated VGAM GENE, encodes a VGAM1694 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1694 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1694 precursor RNA is designated SEQ ID:1680, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1680 is located at position 50970 relative to the genome of Ectocarpus siliculosus virus.

[23674] VGAM1694 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23675] An enzyme complex designated DICER COMPLEX, dices the VGAM1694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1694 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1694 RNA is designated SEQ ID:4405, and is provided hereinbelow with reference to the sequence listing part.

[23676] VGAM1694 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1694 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1694 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23677] VGAM1694 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1694 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1694 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1694 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1694 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23678] The complementary binding of VGAM1694 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1694 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1694 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1694 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23679] It is appreciated that VGAM1694 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1694 host target genes. The mRNA of each one of this plurality of VGAM1694 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1694 RNA, herein designated VGAM RNA, and which when bound by VGAM1694 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1694 host target proteins.

[23680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1694 gene, herein designated VGAM GENE, on one or more VGAM1694 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23681] It is yet further appreciated that a function of VGAM1694 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1694 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1694 correlate with, and may be deduced from, the identity of the host target genes which VGAM1694 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23682] Nucleotide sequences of the VGAM1694 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1694 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1694 are further described hereinbelow with reference to Table 1.

[23683] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1694 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23684] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1695 (VGAM1695) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23685] VGAM1695 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1695 was detected is described hereinabove with reference to Figs. 2-8.

[23686] VGAM1695 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1695 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23687] VGAM1695 gene, herein designated VGAM GENE, encodes a VGAM1695 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1695 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1695 precursor RNA is designated SEQ ID:1681, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1681 is located at position 51375 relative to the genome of Ectocarpus siliculosus virus.

[23688] VGAM1695 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23689] An enzyme complex designated DICER COMPLEX, dices the VGAM1695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1695 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1695 RNA is designated SEQ ID:4406, and is provided hereinbelow with reference to the sequence listing part.

[23690] VGAM1695 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1695 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1695 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23691] VGAM1695 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1695 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1695 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1695 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1695 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23692] The complementary binding of VGAM1695 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1695 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1695 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1695 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[23693] It is appreciated that VGAM1695 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1695 host target genes. The mRNA of each one of this plurality of VGAM1695 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1695 RNA, herein designated VGAM RNA, and which when bound by VGAM1695 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1695 host target proteins.

[23694] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1695 gene, herein designated VGAM GENE, on one or more VGAM1695 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23695] It is yet further appreciated that a function of VGAM1695 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1695 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1695 correlate with, and may be deduced from, the identity of the host target genes which VGAM1695 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23696] Nucleotide sequences of the VGAM1695 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1695 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1695 are further described hereinbelow with reference to Table 1.

[23697] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1695 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23698] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1696 (VGAM1696) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23699] VGAM1696 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1696 was detected is described hereinabove with reference to Figs. 2-8.

[23700] VGAM1696 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1696 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23701] VGAM1696 gene, herein designated VGAM GENE, encodes a VGAM1696 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1696 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1696 precursor RNA is designated SEQ ID:1682, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1682 is located at position 52738 relative to the genome of Ectocarpus siliculosus virus.

[23702] VGAM1696 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23703] An enzyme complex designated DICER COMPLEX, dices the VGAM1696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1696 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1696 RNA is designated SEQ ID:4407, and is provided hereinbelow with reference to the sequence listing part.

[23704] VGAM1696 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1696 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1696 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23705] VGAM1696 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1696 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1696 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1696 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1696 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23706] The complementary binding of VGAM1696 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1696 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1696 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1696 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23707] It is appreciated that VGAM1696 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1696 host target genes. The mRNA of each one of this plurality of VGAM1696 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1696 RNA, herein designated VGAM RNA, and which when bound by VGAM1696 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1696 host target proteins.

[23708] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1696 gene, herein designated VGAM GENE, on one or more VGAM1696 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23709] It is yet further appreciated that a function of VGAM1696 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1696 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1696 correlate with, and may be deduced from, the identity of the host target genes which VGAM1696 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23710] Nucleotide sequences of the VGAM1696 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1696 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1696 are further

described hereinbelow with reference to Table 1.

[23711] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1696 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23712] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1697 (VGAM1697) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23713] VGAM1697 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1697 was detected is described hereinabove with reference to Figs. 2-8.

[23714] VGAM1697 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1697 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23715] VGAM1697 gene, herein designated VGAM GENE, encodes a VGAM1697 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1697 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1697 precursor RNA is designated SEQ ID:1683, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1683 is located at position 50957 relative to the genome of Ectocarpus siliculosus virus.

[23716] VGAM1697 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23717] An enzyme complex designated DICER COMPLEX, dices

the VGAM1697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1697 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1697 RNA is designated SEQ ID:4408, and is provided hereinbelow with reference to the sequence listing part.

[23718] VGAM1697 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1697 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1697 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23719] VGAM1697 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1697 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1697 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1697 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1697 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23720] The complementary binding of VGAM1697 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1697 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1697 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1697 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23721] It is appreciated that VGAM1697 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1697 host target genes. The mRNA of each one of this plurality of VGAM1697 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1697 RNA, herein designated VGAM RNA, and which when bound by VGAM1697 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1697 host target proteins.

[23722] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1697 gene, herein designated VGAM GENE, on one or more VGAM1697 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23723] It is yet further appreciated that a function of VGAM1697 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1697 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1697 correlate with, and may be deduced from, the identity of the host target genes which VGAM1697 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23724] Nucleotide sequences of the VGAM1697 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1697 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1697 are further described hereinbelow with reference to Table 1.

[23725] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1697 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23726] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1698 (VGAM1698) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23727] VGAM1698 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1698 was detected is described hereinabove with reference to Figs. 2-8.

[23728] VGAM1698 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1698 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23729] VGAM1698 gene, herein designated VGAM GENE, encodes a VGAM1698 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1698 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1698 precursor RNA is designated SEQ ID:1684, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1684 is located at position 52499 relative to the genome of Ectocarpus siliculosus virus.

[23730] VGAM1698 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[23731] An enzyme complex designated DICER COMPLEX, dices the VGAM1698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1698 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1698 RNA is designated SEQ ID:4409, and is provided hereinbelow with reference to the sequence listing part.

[23732] VGAM1698 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1698 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1698 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23733] VGAM1698 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1698 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1698 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1698 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1698 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23734] The complementary binding of VGAM1698 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1698 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1698 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1698 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23735] It is appreciated that VGAM1698 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1698 host target genes. The mRNA of each one of this plurality of VGAM1698 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1698 RNA, herein designated VGAM RNA, and which when bound by VGAM1698 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1698 host target proteins.

[23736] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1698 gene, herein designated VGAM GENE, on one or more VGAM1698 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23737] It is yet further appreciated that a function of VGAM1698 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1698 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1698 correlate with, and may be deduced from, the identity of the host target genes which VGAM1698 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23738] Nucleotide sequences of the VGAM1698 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1698 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1698 are further described hereinbelow with reference to Table 1.

[23739] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1698 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23740] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1699 (VGAM1699) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23741] VGAM1699 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1699 was detected is described hereinabove with reference to Figs. 2-8.

[23742] VGAM1699 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Ectocarpus siliculosus virus. VGAM1699 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23743] VGAM1699 gene, herein designated VGAM GENE, encodes a VGAM1699 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1699 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1699 precursor RNA is designated SEQ ID:1685, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1685 is located at position 53142 relative to the genome of Ectocarpus siliculosus virus.

[23744] VGAM1699 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23745] An enzyme complex designated DICER COMPLEX, dices the VGAM1699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1699 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1699 RNA is designated SEQ ID:4410, and is provided hereinbelow with reference to the sequence listing part.

[23746] VGAM1699 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1699 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1699 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[23747] VGAM1699 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1699 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1699 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1699 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1699 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23748] The complementary binding of VGAM1699 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1699 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1699 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1699 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23749] It is appreciated that VGAM1699 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1699 host target genes. The mRNA of each one of this plurality of VGAM1699 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1699 RNA, herein designated VGAM RNA, and which when bound by VGAM1699 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1699 host target proteins.

[23750] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1699 gene, herein designated VGAM GENE, on one

or more VGAM1699 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23751] It is yet further appreciated that a function of VGAM1699 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1699 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1699 correlate with, and may be deduced from, the identity of the host target genes which VGAM1699 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23752] Nucleotide sequences of the VGAM1699 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1699 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1699 are further described hereinbelow with reference to Table 1.

[23753] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1699 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23754] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1700 (VGAM1700) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23755] VGAM1700 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1700 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[23756] VGAM1700 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1700 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23757] VGAM1700 gene, herein designated VGAM GENE, encodes a VGAM1700 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1700 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1700 precursor RNA is designated SEQ ID:1686, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1686 is located at position 54256 relative to the genome of Ectocarpus siliculosus virus.

[23758] VGAM1700 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23759] An enzyme complex designated DICER COMPLEX, dices the VGAM1700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1700 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1700 RNA is designated SEQ ID:4411, and is provided hereinbelow with reference to the sequence listing part.

[23760] VGAM1700 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1700 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1700 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23761] VGAM1700 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1700 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1700 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1700 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1700 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23762] The complementary binding of VGAM1700 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1700 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1700 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1700 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23763] It is appreciated that VGAM1700 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1700 host target genes. The mRNA of each one of this plurality of VGAM1700 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1700 RNA, herein designated VGAM RNA, and which when bound by VGAM1700 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1700 host target proteins.

[23764] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1700 gene, herein designated VGAM GENE, on one or more VGAM1700 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23765] It is yet further appreciated that a function of VGAM1700 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1700 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1700 correlate with, and may be deduced from, the identity of the host target genes which VGAM1700 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[23766] Nucleotide sequences of the VGAM1700 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1700 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1700 are further described hereinbelow with reference to Table 1.

[23767] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1700 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23768] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1701 (VGAM1701) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23769] VGAM1701 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1701 was detected is described hereinabove with reference to Figs. 2-8.

[23770] VGAM1701 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1701 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23771] VGAM1701 gene, herein designated VGAM GENE, encodes a VGAM1701 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1701 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1701 precursor RNA is designated SEQ ID:1687, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1687 is located at position 53594 relative to the genome of Ectocarpus siliculosus virus.

[23772] VGAM1701 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1701 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23773] An enzyme complex designated DICER COMPLEX, dices the VGAM1701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1701 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1701 RNA is designated SEQ ID:4412, and is provided hereinbelow with reference to the sequence listing part.

[23774] VGAM1701 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1701 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1701 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23775] VGAM1701 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1701 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1701 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1701 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1701 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23776] The complementary binding of VGAM1701 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1701 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1701 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1701 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23777] It is appreciated that VGAM1701 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1701 host target genes. The mRNA of each one of this plurality of VGAM1701 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1701 RNA, herein designated VGAM RNA, and which when bound by VGAM1701 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1701 host target proteins.

[23778] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1701 gene, herein designated VGAM GENE, on one or more VGAM1701 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23779] It is yet further appreciated that a function of VGAM1701 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1701 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1701

correlate with, and may be deduced from, the identity of the host target genes which VGAM1701 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23780] Nucleotide sequences of the VGAM1701 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1701 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1701 are further described hereinbelow with reference to Table 1.

[23781] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1701 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23782] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1702 (VGAM1702) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[23783] VGAM1702 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1702 was detected is described hereinabove with reference to Figs. 2-8.

[23784] VGAM1702 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1702 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23785] VGAM1702 gene, herein designated VGAM GENE, encodes a VGAM1702 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1702 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1702 precursor RNA is designated SEQ ID:1688, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1688 is located at position 51117 relative to the genome of Ectocarpus siliculosus virus.

[23786] VGAM1702 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23787] An enzyme complex designated DICER COMPLEX, dices the VGAM1702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1702 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1702 RNA is designated SEQ ID:4413, and is provided hereinbelow with reference to the sequence listing part.

[23788] VGAM1702 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1702 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1702 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23789] VGAM1702 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1702 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1702 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1702 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1702 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23790] The complementary binding of VGAM1702 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1702 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1702 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1702 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23791] It is appreciated that VGAM1702 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1702 host target genes. The mRNA of each one of this plurality of VGAM1702 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1702 RNA, herein designated VGAM RNA, and which when bound by VGAM1702 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1702 host target proteins.

[23792] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1702 gene, herein designated VGAM GENE, on one or more VGAM1702 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23793] It is yet further appreciated that a function of VGAM1702 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1702 include diagnosis, prevention and

treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1702 correlate with, and may be deduced from, the identity of the host target genes which VGAM1702 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23794] Nucleotide sequences of the VGAM1702 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1702 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1702 are further described hereinbelow with reference to Table 1.

[23795] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1702 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23796] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1703 (VGAM1703) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23797] VGAM1703 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1703 was detected is described hereinabove with reference to Figs. 2-8.

[23798] VGAM1703 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1703 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23799] VGAM1703 gene, herein designated VGAM GENE, encodes a VGAM1703 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1703 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1703 precursor RNA is designated SEQ ID:1689, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1689 is located at position 53714 relative to the genome of Ectocarpus siliculosus

virus.

[23800] VGAM1703 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23801] An enzyme complex designated DICER COMPLEX, dices the VGAM1703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1703 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1703 RNA is designated SEQ ID:4414, and is provided hereinbelow with reference to the sequence listing part.

[23802] VGAM1703 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1703 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1703 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23803] VGAM1703 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1703 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1703 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1703 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1703 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23804] The complementary binding of VGAM1703 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1703 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1703 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1703 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23805] It is appreciated that VGAM1703 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1703 host target genes. The mRNA of each one of this plurality of VGAM1703 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1703 RNA, herein designated VGAM RNA, and which when bound by VGAM1703 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1703 host target proteins.

[23806] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1703 gene, herein designated VGAM GENE, on one or more VGAM1703 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23807] It is yet further appreciated that a function of VGAM1703 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1703 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1703 correlate with, and may be deduced from, the identity of the host target genes which VGAM1703 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23808] Nucleotide sequences of the VGAM1703 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1703 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1703 are further described hereinbelow with reference to Table 1.

[23809] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1703 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23810] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1704 (VGAM1704) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23811] VGAM1704 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1704 was detected is described hereinabove with reference to Figs. 2-8.

[23812] VGAM1704 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1704 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23813] VGAM1704 gene, herein designated VGAM GENE, encodes a VGAM1704 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1704 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1704 precursor RNA is designated SEQ ID:1690, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1690 is located at position 52170 relative to the genome of Ectocarpus siliculosus virus.

[23814] VGAM1704 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23815] An enzyme complex designated DICER COMPLEX, dices the VGAM1704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1704 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1704 RNA is designated SEQ ID:4415, and

is provided hereinbelow with reference to the sequence listing part.

[23816] VGAM1704 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1704 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1704 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23817] VGAM1704 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1704 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1704 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1704 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1704 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23818] The complementary binding of VGAM1704 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1704 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1704 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1704 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23819] It is appreciated that VGAM1704 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1704 host target genes. The mRNA of each one of this plurality of VGAM1704 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1704 RNA, herein designated VGAM RNA, and which when bound by VGAM1704 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1704 host target proteins.

[23820] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1704 gene, herein designated VGAM GENE, on one or more VGAM1704 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23821] It is yet further appreciated that a function of VGAM1704 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1704 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1704 correlate with, and may be deduced from, the identity of the host target genes which VGAM1704 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23822] Nucleotide sequences of the VGAM1704 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1704 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1704 are further described hereinbelow with reference to Table 1.

[23823] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1704 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23824] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1705 (VGAM1705) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23825] VGAM1705 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1705 was detected is described hereinabove with reference to Figs. 2-8.

[23826] VGAM1705 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1705 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23827] VGAM1705 gene, herein designated VGAM GENE, encodes a VGAM1705 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1705 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1705 precur-

sor RNA is designated SEQ ID:1691, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1691 is located at position 51223 relative to the genome of Ectocarpus siliculosus virus.

[23828] VGAM1705 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23829] An enzyme complex designated DICER COMPLEX, dices the VGAM1705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1705 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1705 RNA is designated SEQ ID:4416, and is provided hereinbelow with reference to the sequence listing part.

[23830] VGAM1705 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1705 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1705 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23831] VGAM1705 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1705 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1705 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1705 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1705 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23832] The complementary binding of VGAM1705 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1705 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1705 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1705 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23833] It is appreciated that VGAM1705 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1705 host target genes. The mRNA of each one of this plurality of VGAM1705 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1705 RNA, herein designated VGAM RNA, and which when bound by VGAM1705 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1705 host target proteins.

[23834] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1705 gene, herein designated VGAM GENE, on one or more VGAM1705 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23835] It is yet further appreciated that a function of VGAM1705 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1705 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1705 correlate with, and may be deduced from, the identity of the host target genes which VGAM1705 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23836] Nucleotide sequences of the VGAM1705 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1705 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1705 are further described hereinbelow with reference to Table 1.

[23837] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1705 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23838] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1706 (VGAM1706) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23839] VGAM1706 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1706 was detected is described hereinabove with reference to Figs. 2-8.

[23840] VGAM1706 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1706 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23841] VGAM1706 gene, herein designated VGAM GENE, encodes a VGAM1706 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1706 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1706 precursor RNA is designated SEQ ID:1692, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1692 is located at position 54780 relative to the genome of Ectocarpus siliculosus virus.

[23842] VGAM1706 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23843] An enzyme complex designated DICER COMPLEX, dices the VGAM1706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1706 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1706 RNA is designated SEQ ID:4417, and is provided hereinbelow with reference to the sequence listing part.

[23844] VGAM1706 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1706 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1706 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23845] VGAM1706 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1706 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1706 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1706 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1706 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23846] The complementary binding of VGAM1706 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1706 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1706 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1706 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23847] It is appreciated that VGAM1706 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1706 host target genes. The mRNA of each one of this plurality of VGAM1706 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1706 RNA, herein designated VGAM RNA, and which when bound by VGAM1706 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1706 host target proteins.

[23848] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1706 gene, herein designated VGAM GENE, on one or more VGAM1706 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23849] It is yet further appreciated that a function of VGAM1706 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1706 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1706 correlate with, and may be deduced from, the identity of the host target genes which VGAM1706 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23850] Nucleotide sequences of the VGAM1706 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1706 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1706 are further described hereinbelow with reference to Table 1.

[23851] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1706 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23852] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1707 (VGAM1707) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23853] VGAM1707 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1707 was detected is described hereinabove with reference to Figs. 2-8.

[23854] VGAM1707 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM1707 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23855] VGAM1707 gene, herein designated VGAM GENE, encodes a VGAM1707 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1707 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1707 precursor RNA is designated SEQ ID:1693, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1693 is located at position 48576 relative to the genome of Ectocarpus siliculosus virus.

[23856] VGAM1707 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23857] An enzyme complex designated DICER COMPLEX, dices the VGAM1707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1707 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1707 RNA is designated SEQ ID:4418, and is provided hereinbelow with reference to the sequence listing part.

[23858] VGAM1707 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1707 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1707 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23859] VGAM1707 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1707 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1707 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1707 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1707 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23860] The complementary binding of VGAM1707 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1707 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1707 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1707 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23861] It is appreciated that VGAM1707 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1707 host target genes. The mRNA of each one of this plurality of VGAM1707 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1707 RNA, herein designated VGAM RNA, and which when bound by VGAM1707 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1707 host target proteins.

[23862] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1707 gene, herein designated VGAM GENE, on one or more VGAM1707 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23863] It is yet further appreciated that a function of VGAM1707 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1707 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM1707 correlate with, and may be deduced from, the identity of the host target genes which VGAM1707 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23864] Nucleotide sequences of the VGAM1707 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1707 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1707 are further described hereinbelow with reference to Table 1.

[23865] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1707 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23866] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1708 (VGAM1708) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23867] VGAM1708 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1708 was detected is described hereinabove with reference to Figs. 2-8.

[23868] VGAM1708 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine adenovirus B. VGAM1708 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23869] VGAM1708 gene, herein designated VGAM GENE, encodes

a VGAM1708 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1708 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1708 precursor RNA is designated SEQ ID:1694, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1694 is located at position 17661 relative to the genome of Bovine adenovirus B.

[23870] VGAM1708 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23871] An enzyme complex designated DICER COMPLEX, dices the VGAM1708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1708 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1708 RNA is designated SEQ ID:4419, and is provided hereinbelow with reference to the sequence listing part.

[23872] VGAM1708 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1708 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1708 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23873] VGAM1708 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1708 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1708 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1708 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1708 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23874] The complementary binding of VGAM1708 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1708 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1708 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1708 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23875] It is appreciated that VGAM1708 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1708 host target genes. The mRNA of each one of this plurality of VGAM1708 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1708 RNA, herein designated VGAM RNA, and which when bound by VGAM1708 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1708 host target proteins.

[23876] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1708 gene, herein designated VGAM GENE, on one or more VGAM1708 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23877] It is yet further appreciated that a function of VGAM1708 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1708 include diagnosis, prevention and treatment of viral infection by Bovine adenovirus B. Specific functions, and accordingly utilities, of VGAM1708 correlate with, and may be deduced from, the identity of the host target genes which VGAM1708 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23878] Nucleotide sequences of the VGAM1708 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1708 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1708 are further

described hereinbelow with reference to Table 1.

[23879] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1708 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23880] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1709 (VGAM1709) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23881] VGAM1709 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1709 was detected is described hereinabove with reference to Figs. 2-8.

[23882] VGAM1709 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Semliki forest virus. VGAM1709 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23883] VGAM1709 gene, herein designated VGAM GENE, encodes a VGAM1709 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1709 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1709 precursor RNA is designated SEQ ID:1695, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1695 is located at position 4455 relative to the genome of Semliki forest virus.

[23884] VGAM1709 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23885] An enzyme complex designated DICER COMPLEX, dices the VGAM1709 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1709 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1709 RNA is designated SEQ ID:4420, and is provided hereinbelow with reference to the sequence listing part.

[23886] VGAM1709 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1709 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1709 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23887] VGAM1709 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1709 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1709 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1709 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1709 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23888] The complementary binding of VGAM1709 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1709 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1709

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1709 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23889] It is appreciated that VGAM1709 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1709 host target genes. The mRNA of each one of this plurality of VGAM1709 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1709 RNA, herein designated VGAM RNA, and which when bound by VGAM1709 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1709 host target proteins.

[23890] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1709 gene, herein designated VGAM GENE, on one or more VGAM1709 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23891] It is yet further appreciated that a function of VGAM1709 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1709 include diagnosis, prevention and treatment of viral infection by Semliki forest virus. Specific functions, and accordingly utilities, of VGAM1709 correlate with, and may be deduced from, the identity of the host target genes which VGAM1709 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23892] Nucleotide sequences of the VGAM1709 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1709 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1709 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1709 are further described hereinbelow with reference to Table 1.

[23893] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1709 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23894] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1710 (VGAM1710) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23895] VGAM1710 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1710 was detected is described hereinabove with reference to Figs. 2-8.

[23896] VGAM1710 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Semliki forest virus. VGAM1710 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[23897] VGAM1710 gene, herein designated VGAM GENE, encodes a VGAM1710 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1710 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1710 precursor RNA is designated SEQ ID:1696, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1696 is located at position 7249 relative to the genome of Semliki forest virus.

[23898] VGAM1710 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23899] An enzyme complex designated DICER COMPLEX, dices

the VGAM1710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1710 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1710 RNA is designated SEQ ID:4421, and is provided hereinbelow with reference to the sequence listing part.

[23900] VGAM1710 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1710 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1710 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23901] VGAM1710 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1710 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1710 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1710 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1710 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23902] The complementary binding of VGAM1710 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1710 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1710 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1710 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23903] It is appreciated that VGAM1710 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1710 host target genes. The mRNA of each one of this plurality of VGAM1710 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1710 RNA, herein designated VGAM RNA, and which when bound by VGAM1710 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1710 host target proteins.

[23904] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1710 gene, herein designated VGAM GENE, on one or more VGAM1710 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23905] It is yet further appreciated that a function of VGAM1710 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1710 include diagnosis, prevention and treatment of viral infection by Semliki forest virus. Specific functions, and accordingly utilities, of VGAM1710 correlate with, and may be deduced from, the identity of the host target genes which VGAM1710 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23906] Nucleotide sequences of the VGAM1710 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1710 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1710 are further described hereinbelow with reference to Table 1.

[23907] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1710 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23908] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1711 (VGAM1711) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23909] VGAM1711 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1711 was detected is described hereinabove with reference to Figs. 2-8.

[23910] VGAM1711 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Semliki forest virus. VGAM1711 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[23911] VGAM1711 gene, herein designated VGAM GENE, encodes a VGAM1711 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1711 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1711 precursor RNA is designated SEQ ID:1697, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1697 is located at position 4081 relative to the genome of Semliki forest virus.

[23912] VGAM1711 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23913] An enzyme complex designated DICER COMPLEX, dices the VGAM1711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1711 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1711 RNA is designated SEQ ID:4422, and is provided hereinbelow with reference to the sequence listing part.

[23914] VGAM1711 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1711 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1711 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23915] VGAM1711 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1711 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1711 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1711 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1711 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23916] The complementary binding of VGAM1711 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1711 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1711 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1711 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23917] It is appreciated that VGAM1711 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1711 host target genes. The mRNA of each one of this plurality of VGAM1711 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1711 RNA, herein designated VGAM RNA, and which when bound by VGAM1711 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1711 host target proteins.

[23918] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1711 gene, herein designated VGAM GENE, on one or more VGAM1711 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23919] It is yet further appreciated that a function of VGAM1711 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1711 include diagnosis, prevention and treatment of viral infection by Semliki forest virus. Specific functions, and accordingly utilities, of VGAM1711 correlate with, and may be deduced from, the identity of the host target genes which VGAM1711 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23920] Nucleotide sequences of the VGAM1711 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1711 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1711 are further described hereinbelow with reference to Table 1.

[23921] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1711 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23922] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1712 (VGAM1712) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23923] VGAM1712 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1712 was detected is described hereinabove with reference to Figs. 2-8.

[23924] VGAM1712 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sindbis virus.

VGAM1712 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23925] VGAM1712 gene, herein designated VGAM GENE, encodes a VGAM1712 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1712 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1712 precursor RNA is designated SEQ ID:1698, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1698 is located at position 8817 relative to the genome of Sindbis virus.

[23926] VGAM1712 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[23927] An enzyme complex designated DICER COMPLEX, dices the VGAM1712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1712 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1712 RNA is designated SEQ ID:4423, and is provided hereinbelow with reference to the sequence listing part.

[23928] VGAM1712 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1712 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1712 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23929] VGAM1712 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1712 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1712 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1712 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1712 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23930] The complementary binding of VGAM1712 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1712 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1712 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1712 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23931] It is appreciated that VGAM1712 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1712 host target genes. The mRNA of each one of this plurality of VGAM1712 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1712 RNA, herein designated VGAM RNA, and which when bound by VGAM1712 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1712 host target proteins.

[23932] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1712 gene, herein designated VGAM GENE, on one or more VGAM1712 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23933] It is yet further appreciated that a function of VGAM1712 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1712 include diagnosis, prevention and treatment of viral infection by Sindbis virus. Specific functions, and accordingly utilities, of VGAM1712 correlate with, and may be deduced from, the identity of the host target genes which VGAM1712 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23934] Nucleotide sequences of the VGAM1712 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1712 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1712 are further described hereinbelow with reference to Table 1.

[23935] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1712 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23936] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1713 (VGAM1713) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23937] VGAM1713 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1713 was detected is described hereinabove with reference to Figs. 2-8.

[23938] VGAM1713 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Sindbis virus. VGAM1713 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23939] VGAM1713 gene, herein designated VGAM GENE, encodes a VGAM1713 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1713 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1713 precursor RNA is designated SEQ ID:1699, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1699 is located at position 8146 relative to the genome of Sindbis virus.

[23940] VGAM1713 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23941] An enzyme complex designated DICER COMPLEX, dices the VGAM1713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1713 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1713 RNA is designated SEQ ID:4424, and is provided hereinbelow with reference to the sequence listing part.

[23942] VGAM1713 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1713 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1713 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23943] VGAM1713 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1713 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1713 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1713 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1713 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23944] The complementary binding of VGAM1713 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1713 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1713 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1713 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23945] It is appreciated that VGAM1713 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1713 host target genes. The mRNA of each one of this plurality of VGAM1713 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1713 RNA, herein designated VGAM RNA, and which when bound by VGAM1713 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1713 host target proteins.

[23946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1713 gene, herein designated VGAM GENE, on one or more VGAM1713 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23947] It is yet further appreciated that a function of VGAM1713 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1713 include diagnosis, prevention and treatment of viral infection by Sindbis virus. Specific functions, and accordingly utilities, of VGAM1713 correlate with, and may be deduced from, the identity of the host target genes which VGAM1713 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23948] Nucleotide sequences of the VGAM1713 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1713 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1713 are further described hereinbelow with reference to Table 1.

[23949] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1713 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23950] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1714 (VGAM1714) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23951] VGAM1714 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1714 was detected is described hereinabove with reference to Figs. 2-8.

[23952] VGAM1714 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sindbis virus. VGAM1714 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23953] VGAM1714 gene, herein designated VGAM GENE, encodes a VGAM1714 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1714 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1714 precursor RNA is designated SEQ ID:1700, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1700 is located at position 9679 relative to the genome of Sindbis virus.

[23954] VGAM1714 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23955] An enzyme complex designated DICER COMPLEX, dices the VGAM1714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1714 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1714 RNA is designated SEQ ID:4425, and is provided hereinbelow with reference to the sequence listing part.

[23956] VGAM1714 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1714 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1714 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[23957] VGAM1714 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1714 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1714 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1714 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1714 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23958] The complementary binding of VGAM1714 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1714 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1714 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1714 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23959] It is appreciated that VGAM1714 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1714 host target genes. The mRNA of each one of this plurality of VGAM1714 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1714 RNA, herein designated VGAM RNA, and which when bound by VGAM1714 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1714 host target proteins.

[23960] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1714 gene, herein designated VGAM GENE, on one

or more VGAM1714 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23961] It is yet further appreciated that a function of VGAM1714 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1714 include diagnosis, prevention and treatment of viral infection by Sindbis virus. Specific functions, and accordingly utilities, of VGAM1714 correlate with, and may be deduced from, the identity of the host target genes which VGAM1714 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23962] Nucleotide sequences of the VGAM1714 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1714 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1714 are further described hereinbelow with reference to Table 1.

[23963] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1714 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23964] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1715 (VGAM1715) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23965] VGAM1715 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1715 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[23966] VGAM1715 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sindbis virus. VGAM1715 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23967] VGAM1715 gene, herein designated VGAM GENE, encodes a VGAM1715 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1715 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1715 precursor RNA is designated SEQ ID:1701, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1701 is located at position 10643 relative to the genome of Sindbis virus.

[23968] VGAM1715 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23969] An enzyme complex designated DICER COMPLEX, dices the VGAM1715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1715 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1715 RNA is designated SEQ ID:4426, and is provided hereinbelow with reference to the sequence listing part.

[23970] VGAM1715 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1715 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1715 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23971] VGAM1715 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1715 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1715 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1715 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1715 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[23972] The complementary binding of VGAM1715 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1715 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1715 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1715 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23973] It is appreciated that VGAM1715 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1715 host target genes. The mRNA of each one of this plurality of VGAM1715 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1715 RNA, herein designated VGAM RNA, and which when bound by VGAM1715 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1715 host target proteins.

[23974] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1715 gene, herein designated VGAM GENE, on one or more VGAM1715 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23975] It is yet further appreciated that a function of VGAM1715 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1715 include diagnosis, prevention and treatment of viral infection by Sindbis virus. Specific functions, and accordingly utilities, of VGAM1715 correlate with, and may be deduced from, the identity of the host target genes which VGAM1715 binds and inhibits, and the function of these host target genes, as elaborated herein-

below.

[23976] Nucleotide sequences of the VGAM1715 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1715 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1715 are further described hereinbelow with reference to Table 1.

[23977] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1715 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23978] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1716 (VGAM1716) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23979] VGAM1716 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1716 was detected is described hereinabove with reference to Figs. 2-8.

[23980] VGAM1716 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sindbis virus. VGAM1716 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23981] VGAM1716 gene, herein designated VGAM GENE, encodes a VGAM1716 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1716 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1716 precursor RNA is designated SEQ ID:1702, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1702 is located at position 8996 relative to the genome of Sindbis virus.

[23982] VGAM1716 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23983] An enzyme complex designated DICER COMPLEX, dices the VGAM1716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1716 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1716 RNA is designated SEQ ID:4427, and is provided hereinbelow with reference to the sequence listing part.

[23984] VGAM1716 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1716 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1716 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23985] VGAM1716 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1716 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1716 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1716 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1716 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23986] The complementary binding of VGAM1716 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1716 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1716 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1716 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23987] It is appreciated that VGAM1716 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1716 host target genes. The mRNA of each one of this plurality of VGAM1716 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1716 RNA, herein designated VGAM RNA, and which when bound by VGAM1716 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1716 host target proteins.

[23988] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1716 gene, herein designated VGAM GENE, on one or more VGAM1716 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23989] It is yet further appreciated that a function of VGAM1716 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1716 include diagnosis, prevention and treatment of viral infection by Sindbis virus. Specific functions, and accordingly utilities, of VGAM1716 correlate with, and may be deduced from, the identity of the host target genes which VGAM1716 binds and inhibits, and the

function of these host target genes, as elaborated hereinbelow.

[23990] Nucleotide sequences of the VGAM1716 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1716 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1716 are further described hereinbelow with reference to Table 1.

[23991] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1716 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23992] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1717 (VGAM1717) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23993] VGAM1717 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1717 was detected is described hereinabove with reference to Figs. 2-8.

[23994] VGAM1717 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM1717 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23995] VGAM1717 gene, herein designated VGAM GENE, encodes a VGAM1717 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1717 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1717 precursor RNA is designated SEQ ID:1703, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1703 is located at position 67026 relative to the genome of Molluscum contagiosum virus.

[23996] VGAM1717 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1717 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23997] An enzyme complex designated DICER COMPLEX, dices the VGAM1717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1717 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1717 RNA is designated SEQ ID:4428, and is provided hereinbelow with reference to the sequence listing part.

[23998] VGAM1717 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1717 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1717 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23999] VGAM1717 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1717 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1717 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1717 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1717 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24000] The complementary binding of VGAM1717 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1717 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1717 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1717 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24001] It is appreciated that VGAM1717 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1717 host target genes. The mRNA of each one of this plurality of VGAM1717 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1717 RNA, herein designated VGAM RNA, and which when bound by VGAM1717 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1717 host target proteins.

[24002] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1717 gene, herein designated VGAM GENE, on one or more VGAM1717 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24003] It is yet further appreciated that a function of VGAM1717 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1717 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of

VGAM1717 correlate with, and may be deduced from, the identity of the host target genes which VGAM1717 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24004] Nucleotide sequences of the VGAM1717 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1717 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1717 are further described hereinbelow with reference to Table 1.

[24005] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1717 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24006] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1718 (VGAM1718) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[24007] VGAM1718 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1718 was detected is described hereinabove with reference to Figs. 2-8.

[24008] VGAM1718 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM1718 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24009] VGAM1718 gene, herein designated VGAM GENE, encodes a VGAM1718 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1718 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1718 precursor RNA is designated SEQ ID:1704, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1704 is located at position 64920 relative to the genome of Molluscum contagiosum virus.

[24010] VGAM1718 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24011] An enzyme complex designated DICER COMPLEX, dices the VGAM1718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1718 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1718 RNA is designated SEQ ID:4429, and is provided hereinbelow with reference to the sequence listing part.

[24012] VGAM1718 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1718 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1718 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24013] VGAM1718 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1718 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1718 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1718 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1718 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24014] The complementary binding of VGAM1718 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1718 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1718 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1718 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24015] It is appreciated that VGAM1718 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1718 host target genes. The mRNA of each one of this plurality of VGAM1718 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1718 RNA, herein designated VGAM RNA, and which when bound by VGAM1718 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1718 host target proteins.

[24016] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1718 gene, herein designated VGAM GENE, on one or more VGAM1718 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24017] It is yet further appreciated that a function of VGAM1718 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1718 include diagnosis, prevention and

treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM1718 correlate with, and may be deduced from, the identity of the host target genes which VGAM1718 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24018] Nucleotide sequences of the VGAM1718 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1718 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1718 are further described hereinbelow with reference to Table 1.

[24019] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1718 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24020] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1719 (VGAM1719) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24021] VGAM1719 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1719 was detected is described hereinabove with reference to Figs. 2-8.

[24022] VGAM1719 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM1719 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24023] VGAM1719 gene, herein designated VGAM GENE, encodes a VGAM1719 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1719 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1719 precursor RNA is designated SEQ ID:1705, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1705 is located at position 110474 relative to the genome of Rat cytomegalovirus.

[24024] VGAM1719 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24025] An enzyme complex designated DICER COMPLEX, dices the VGAM1719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1719 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1719 RNA is designated SEQ ID:4430, and is provided hereinbelow with reference to the sequence listing part.

[24026] VGAM1719 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1719 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1719 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24027] VGAM1719 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1719 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1719 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1719 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1719 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24028] The complementary binding of VGAM1719 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1719 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1719 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1719 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24029] It is appreciated that VGAM1719 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1719 host target genes. The mRNA of each one of this plurality of VGAM1719 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1719 RNA, herein designated VGAM

RNA, and which when bound by VGAM1719 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1719 host target proteins.

[24030] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1719 gene, herein designated VGAM GENE, on one or more VGAM1719 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24031] It is yet further appreciated that a function of VGAM1719 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1719 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1719 correlate with, and may be deduced from, the identity of the host target genes which VGAM1719 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24032] Nucleotide sequences of the VGAM1719 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1719 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1719 are further described hereinbelow with reference to Table 1.

[24033] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1719 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24034] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1720 (VGAM1720) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24035] VGAM1720 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1720 was detected is described hereinabove with reference to Figs. 2-8.

[24036] VGAM1720 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM1720 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24037] VGAM1720 gene, herein designated VGAM GENE, encodes a VGAM1720 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1720 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1720 precursor RNA is designated SEQ ID:1706, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1706 is located at position

111844 relative to the genome of Rat cytomegalovirus.

[24038] VGAM1720 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24039] An enzyme complex designated DICER COMPLEX, dices the VGAM1720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1720 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1720 RNA is designated SEQ ID:4431, and is provided hereinbelow with reference to the sequence listing part.

[24040] VGAM1720 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1720 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1720 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24041] VGAM1720 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1720 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1720 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1720 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1720 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24042] The complementary binding of VGAM1720 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1720 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1720 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1720 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24043] It is appreciated that VGAM1720 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1720 host target genes. The mRNA of each one of this plurality of VGAM1720 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1720 RNA, herein designated VGAM RNA, and which when bound by VGAM1720 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1720 host target proteins.

[24044] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1720 gene, herein designated VGAM GENE, on one or more VGAM1720 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24045] It is yet further appreciated that a function of VGAM1720 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1720 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1720 correlate with, and may be deduced from, the identity of the host target genes which VGAM1720 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24046] Nucleotide sequences of the VGAM1720 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1720 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1720 are further described hereinbelow with reference to Table 1.

[24047] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1720 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24048] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1721 (VGAM1721) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24049] VGAM1721 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1721 was detected is described hereinabove with reference to Figs. 2-8.

[24050] VGAM1721 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM1721 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24051] VGAM1721 gene, herein designated VGAM GENE, encodes a VGAM1721 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1721 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1721 precursor RNA is designated SEQ ID:1707, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1707 is located at position 8494 relative to the genome of Myxoma virus.

[24052] VGAM1721 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24053] An enzyme complex designated DICER COMPLEX, dices the VGAM1721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1721 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1721 RNA is designated SEQ ID:4432, and is provided hereinbelow with reference to the sequence

listing part.

[24054] VGAM1721 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1721 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1721 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24055] VGAM1721 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1721 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1721 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1721 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1721 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24056] The complementary binding of VGAM1721 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1721 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1721 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1721 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24057] It is appreciated that VGAM1721 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1721 host target genes. The mRNA of each one of this plurality of VGAM1721 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1721 RNA, herein designated VGAM RNA, and which when bound by VGAM1721 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1721 host target proteins.

[24058] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1721 gene, herein designated VGAM GENE, on one or more VGAM1721 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24059] It is yet further appreciated that a function of VGAM1721

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1721 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM1721 correlate with, and may be deduced from, the identity of the host target genes which VGAM1721 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24060] Nucleotide sequences of the VGAM1721 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1721 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1721 are further described hereinbelow with reference to Table 1.

[24061] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1721 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24062] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1722 (VGAM1722) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24063] VGAM1722 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1722 was detected is described hereinabove with reference to Figs. 2-8.

[24064] VGAM1722 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM1722 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24065] VGAM1722 gene, herein designated VGAM GENE, encodes a VGAM1722 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1722 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1722 precursor RNA is designated SEQ ID:1708, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1708 is located at position 4765 relative to the genome of Myxoma virus.

[24066] VGAM1722 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24067] An enzyme complex designated DICER COMPLEX, dices the VGAM1722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1722 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1722 RNA is designated SEQ ID:4433, and

is provided hereinbelow with reference to the sequence listing part.

[24068] VGAM1722 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1722 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1722 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24069] VGAM1722 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1722 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1722 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1722 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1722 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24070] The complementary binding of VGAM1722 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1722 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1722 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1722 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24071] It is appreciated that VGAM1722 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1722 host target genes. The mRNA of each one of this plurality of VGAM1722 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1722 RNA, herein designated VGAM RNA, and which when bound by VGAM1722 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1722 host target proteins.

[24072] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1722 gene, herein designated VGAM GENE, on one or more VGAM1722 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24073] It is yet further appreciated that a function of VGAM1722 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1722 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM1722 correlate with, and may be deduced from, the identity of the host target genes which VGAM1722 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24074] Nucleotide sequences of the VGAM1722 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1722 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1722 are further described hereinbelow with reference to Table 1.

[24075] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1722 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24076] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1723 (VGAM1723) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24077] VGAM1723 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1723 was detected is described hereinabove with reference to Figs. 2-8.

[24078] VGAM1723 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus.
VGAM1723 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24079] VGAM1723 gene, herein designated VGAM GENE, encodes a VGAM1723 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1723 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1723 precur-

sor RNA is designated SEQ ID:1709, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1709 is located at position 4097 relative to the genome of Myxoma virus.

[24080] VGAM1723 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24081] An enzyme complex designated DICER COMPLEX, dices the VGAM1723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1723 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM1723 RNA is designated SEQ ID:4434, and is provided hereinbelow with reference to the sequence listing part.

[24082] VGAM1723 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1723 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1723 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24083] VGAM1723 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1723 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1723 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1723 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1723 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24084] The complementary binding of VGAM1723 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1723 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1723 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1723 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24085] It is appreciated that VGAM1723 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1723 host target genes. The mRNA of

each one of this plurality of VGAM1723 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1723 RNA, herein designated VGAM RNA, and which when bound by VGAM1723 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1723 host target proteins.

[24086] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1723 gene, herein designated VGAM GENE, on one or more VGAM1723 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24087] It is yet further appreciated that a function of VGAM1723 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1723 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM1723 correlate with, and may be deduced from, the identity of the host target genes which VGAM1723 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24088] Nucleotide sequences of the VGAM1723 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1723 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1723 are further described hereinbelow with reference to Table 1.

[24089] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1723 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24090] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1724 (VGAM1724) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24091] VGAM1724 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1724 was detected is described hereinabove with reference to Figs. 2-8.

[24092] VGAM1724 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM1724 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24093] VGAM1724 gene, herein designated VGAM GENE, encodes a VGAM1724 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1724 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1724 precur-

sor RNA is designated SEQ ID:1710, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1710 is located at position 3898 relative to the genome of Rabies virus.

[24094] VGAM1724 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24095] An enzyme complex designated DICER COMPLEX, dices the VGAM1724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1724 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM1724 RNA is designated SEQ ID:4435, and is provided hereinbelow with reference to the sequence listing part.

[24096] VGAM1724 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1724 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1724 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24097] VGAM1724 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1724 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1724 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1724 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1724 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24098] The complementary binding of VGAM1724 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1724 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1724 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1724 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24099] It is appreciated that VGAM1724 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1724 host target genes. The mRNA of

each one of this plurality of VGAM1724 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1724 RNA, herein designated VGAM RNA, and which when bound by VGAM1724 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1724 host target proteins.

[24100] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1724 gene, herein designated VGAM GENE, on one or more VGAM1724 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24101] It is yet further appreciated that a function of VGAM1724 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1724 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM1724 correlate with, and may be deduced from, the identity of the host target genes which VGAM1724 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24102] Nucleotide sequences of the VGAM1724 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1724 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1724 are further described hereinbelow with reference to Table 1.

[24103] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1724 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24104] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1725 (VGAM1725) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24105] VGAM1725 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1725 was detected is described hereinabove with reference to Figs. 2-8.

[24106] VGAM1725 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM1725 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24107] VGAM1725 gene, herein designated VGAM GENE, encodes a VGAM1725 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1725 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1725 precur-

sor RNA is designated SEQ ID:1711, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1711 is located at position 8659 relative to the genome of Rabies virus.

[24108] VGAM1725 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24109] An enzyme complex designated DICER COMPLEX, dices the VGAM1725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1725 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM1725 RNA is designated SEQ ID:4436, and is provided hereinbelow with reference to the sequence listing part.

[24110] VGAM1725 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1725 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1725 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24111] VGAM1725 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1725 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1725 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1725 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1725 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24112] The complementary binding of VGAM1725 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1725 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1725 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1725 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24113] It is appreciated that VGAM1725 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1725 host target genes. The mRNA of

each one of this plurality of VGAM1725 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1725 RNA, herein designated VGAM RNA, and which when bound by VGAM1725 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1725 host target proteins.

[24114] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1725 gene, herein designated VGAM GENE, on one or more VGAM1725 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24115] It is yet further appreciated that a function of VGAM1725 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1725 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM1725 correlate with, and may be deduced from, the identity of the host target genes which VGAM1725 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24116] Nucleotide sequences of the VGAM1725 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1725 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1725 are further described hereinbelow with reference to Table 1.

[24117] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1725 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24118] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1726 (VGAM1726) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24119] VGAM1726 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1726 was detected is described hereinabove with reference to Figs. 2-8.

[24120] VGAM1726 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM1726 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24121] VGAM1726 gene, herein designated VGAM GENE, encodes a VGAM1726 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1726 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1726 precur-

sor RNA is designated SEQ ID:1712, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1712 is located at position 9658 relative to the genome of Rabies virus.

[24122] VGAM1726 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24123] An enzyme complex designated DICER COMPLEX, dices the VGAM1726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1726 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1726 RNA is designated SEQ ID:4437, and is provided hereinbelow with reference to the sequence listing part.

[24124] VGAM1726 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1726 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1726 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24125] VGAM1726 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1726 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1726 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1726 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1726 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24126] The complementary binding of VGAM1726 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1726 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1726 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1726 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24127] It is appreciated that VGAM1726 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1726 host target genes. The mRNA of

each one of this plurality of VGAM1726 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1726 RNA, herein designated VGAM RNA, and which when bound by VGAM1726 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1726 host target proteins.

[24128] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1726 gene, herein designated VGAM GENE, on one or more VGAM1726 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24129] It is yet further appreciated that a function of VGAM1726 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1726 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM1726 correlate with, and may be deduced from, the identity of the host target genes which VGAM1726 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24130] Nucleotide sequences of the VGAM1726 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1726 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1726 are further described hereinbelow with reference to Table 1.

[24131] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1726 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24132] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1727 (VGAM1727) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24133] VGAM1727 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1727 was detected is described hereinabove with reference to Figs. 2-8.

[24134] VGAM1727 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM1727 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24135] VGAM1727 gene, herein designated VGAM GENE, encodes a VGAM1727 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1727 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1727 precur-

sor RNA is designated SEQ ID:1713, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1713 is located at position 8962 relative to the genome of Rabies virus.

[24136] VGAM1727 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24137] An enzyme complex designated DICER COMPLEX, dices the VGAM1727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1727 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1727 RNA is designated SEQ ID:4438, and is provided hereinbelow with reference to the sequence listing part.

[24138] VGAM1727 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1727 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1727 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24139] VGAM1727 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1727 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1727 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1727 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1727 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24140] The complementary binding of VGAM1727 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1727 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1727 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1727 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24141] It is appreciated that VGAM1727 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1727 host target genes. The mRNA of

each one of this plurality of VGAM1727 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1727 RNA, herein designated VGAM RNA, and which when bound by VGAM1727 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1727 host target proteins.

[24142] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1727 gene, herein designated VGAM GENE, on one or more VGAM1727 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24143] It is yet further appreciated that a function of VGAM1727 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1727 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM1727 correlate with, and may be deduced from, the identity of the host target genes which VGAM1727 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24144] Nucleotide sequences of the VGAM1727 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1727 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1727 are further described hereinbelow with reference to Table 1.

[24145] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1727 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24146] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1728 (VGAM1728) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24147] VGAM1728 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1728 was detected is described hereinabove with reference to Figs. 2-8.

[24148] VGAM1728 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM1728 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24149] VGAM1728 gene, herein designated VGAM GENE, encodes a VGAM1728 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1728 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1728 precur-

sor RNA is designated SEQ ID:1714, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1714 is located at position 4718 relative to the genome of Rabies virus.

[24150] VGAM1728 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24151] An enzyme complex designated DICER COMPLEX, dices the VGAM1728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1728 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM1728 RNA is designated SEQ ID:4439, and is provided hereinbelow with reference to the sequence listing part.

[24152] VGAM1728 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1728 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1728 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24153] VGAM1728 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1728 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1728 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1728 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1728 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24154] The complementary binding of VGAM1728 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1728 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1728 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1728 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24155] It is appreciated that VGAM1728 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1728 host target genes. The mRNA of

each one of this plurality of VGAM1728 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1728 RNA, herein designated VGAM RNA, and which when bound by VGAM1728 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1728 host target proteins.

[24156] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1728 gene, herein designated VGAM GENE, on one or more VGAM1728 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24157] It is yet further appreciated that a function of VGAM1728 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1728 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM1728 correlate with, and may be deduced from, the identity of the host target genes which VGAM1728 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24158] Nucleotide sequences of the VGAM1728 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1728 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1728 are further described hereinbelow with reference to Table 1.

[24159] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1728 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24160] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1729 (VGAM1729) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24161] VGAM1729 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1729 was detected is described hereinabove with reference to Figs. 2-8.

[24162] VGAM1729 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM1729 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24163] VGAM1729 gene, herein designated VGAM GENE, encodes a VGAM1729 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1729 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1729 precur-

sor RNA is designated SEQ ID:1715, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1715 is located at position 8293 relative to the genome of Rabies virus.

[24164] VGAM1729 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24165] An enzyme complex designated DICER COMPLEX, dices the VGAM1729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1729 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide se-

quence of VGAM1729 RNA is designated SEQ ID:4440, and is provided hereinbelow with reference to the sequence listing part.

[24166] VGAM1729 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1729 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1729 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24167] VGAM1729 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1729 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1729 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1729 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1729 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24168] The complementary binding of VGAM1729 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1729 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1729 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1729 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24169] It is appreciated that VGAM1729 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1729 host target genes. The mRNA of

each one of this plurality of VGAM1729 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1729 RNA, herein designated VGAM RNA, and which when bound by VGAM1729 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1729 host target proteins.

[24170] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1729 gene, herein designated VGAM GENE, on one or more VGAM1729 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24171] It is yet further appreciated that a function of VGAM1729 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1729 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM1729 correlate with, and may be deduced from, the identity of the host target genes which VGAM1729 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24172] Nucleotide sequences of the VGAM1729 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1729 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1729 are further described hereinbelow with reference to Table 1.

[24173] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1729 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24174] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1730 (VGAM1730) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24175] VGAM1730 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1730 was detected is described hereinabove with reference to Figs. 2-8.

[24176] VGAM1730 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM1730 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24177] VGAM1730 gene, herein designated VGAM GENE, encodes a VGAM1730 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1730 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1730 precur-

sor RNA is designated SEQ ID:1716, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1716 is located at position 6659 relative to the genome of Rabies virus.

[24178] VGAM1730 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24179] An enzyme complex designated DICER COMPLEX, dices the VGAM1730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1730 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM1730 RNA is designated SEQ ID:4441, and is provided hereinbelow with reference to the sequence listing part.

[24180] VGAM1730 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1730 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1730 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24181] VGAM1730 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1730 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1730 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1730 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24182] The complementary binding of VGAM1730 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1730 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1730 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1730 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24183] It is appreciated that VGAM1730 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1730 host target genes. The mRNA of

each one of this plurality of VGAM1730 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1730 RNA, herein designated VGAM RNA, and which when bound by VGAM1730 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1730 host target proteins.

[24184] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1730 gene, herein designated VGAM GENE, on one or more VGAM1730 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24185] It is yet further appreciated that a function of VGAM1730 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM1730 correlate with, and may be deduced from, the identity of the host target genes which VGAM1730 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24186] Nucleotide sequences of the VGAM1730 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1730 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1730 are further described hereinbelow with reference to Table 1.

[24187] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1730 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24188] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1731 (VGAM1731) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24189] VGAM1731 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1731 was detected is described hereinabove with reference to Figs. 2-8.

[24190] VGAM1731 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM1731 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24191] VGAM1731 gene, herein designated VGAM GENE, encodes a VGAM1731 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1731 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1731 precur-

sor RNA is designated SEQ ID:1717, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1717 is located at position 3422 relative to the genome of Rabies virus.

[24192] VGAM1731 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24193] An enzyme complex designated DICER COMPLEX, dices the VGAM1731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1731 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide se-

quence of VGAM1731 RNA is designated SEQ ID:4442, and is provided hereinbelow with reference to the sequence listing part.

[24194] VGAM1731 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1731 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1731 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24195] VGAM1731 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1731 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1731 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1731 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24196] The complementary binding of VGAM1731 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1731 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1731 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1731 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24197] It is appreciated that VGAM1731 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1731 host target genes. The mRNA of

each one of this plurality of VGAM1731 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1731 RNA, herein designated VGAM RNA, and which when bound by VGAM1731 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1731 host target proteins.

[24198] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1731 gene, herein designated VGAM GENE, on one or more VGAM1731 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24199] It is yet further appreciated that a function of VGAM1731 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM1731 correlate with, and may be deduced from, the identity of the host target genes which VGAM1731 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24200] Nucleotide sequences of the VGAM1731 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1731 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1731 are further described hereinbelow with reference to Table 1.

[24201] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1731 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24202] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1732 (VGAM1732) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24203] VGAM1732 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1732 was detected is described hereinabove with reference to Figs. 2-8.

[24204] VGAM1732 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM1732 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24205] VGAM1732 gene, herein designated VGAM GENE, encodes a VGAM1732 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1732 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1732 precur-

sor RNA is designated SEQ ID:1718, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1718 is located at position 9788 relative to the genome of Rabies virus.

[24206] VGAM1732 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24207] An enzyme complex designated DICER COMPLEX, dices the VGAM1732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1732 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide se-

quence of VGAM1732 RNA is designated SEQ ID:4443, and is provided hereinbelow with reference to the sequence listing part.

[24208] VGAM1732 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1732 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1732 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24209] VGAM1732 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1732 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1732 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1732 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24210] The complementary binding of VGAM1732 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1732 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1732 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1732 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24211] It is appreciated that VGAM1732 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1732 host target genes. The mRNA of

each one of this plurality of VGAM1732 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1732 RNA, herein designated VGAM RNA, and which when bound by VGAM1732 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1732 host target proteins.

[24212] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1732 gene, herein designated VGAM GENE, on one or more VGAM1732 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24213] It is yet further appreciated that a function of VGAM1732 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM1732 correlate with, and may be deduced from, the identity of the host target genes which VGAM1732 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24214] Nucleotide sequences of the VGAM1732 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1732 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1732 are further described hereinbelow with reference to Table 1.

[24215] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1732 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24216] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1733 (VGAM1733) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24217] VGAM1733 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1733 was detected is described hereinabove with reference to Figs. 2-8.

[24218] VGAM1733 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM1733 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24219] VGAM1733 gene, herein designated VGAM GENE, encodes a VGAM1733 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1733 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1733 precursor RNA is designated SEQ ID:1719, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1719 is located at position 40756 relative to the genome of Human herpesvirus 3.

[24220] VGAM1733 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24221] An enzyme complex designated DICER COMPLEX, dices the VGAM1733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1733 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1733 RNA is designated SEQ ID:4444, and is provided hereinbelow with reference to the sequence listing part.

[24222] VGAM1733 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1733 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1733 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24223] VGAM1733 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1733 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1733 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1733 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1733 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24224] The complementary binding of VGAM1733 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1733 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1733 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1733 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24225] It is appreciated that VGAM1733 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1733 host target genes. The mRNA of each one of this plurality of VGAM1733 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1733 RNA, herein designated VGAM RNA, and which when bound by VGAM1733 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1733 host target proteins.

[24226] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1733 gene, herein designated VGAM GENE, on one or more VGAM1733 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24227] It is yet further appreciated that a function of VGAM1733 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1733 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1733 correlate with, and may be deduced from, the identity of the host target genes which VGAM1733 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24228] Nucleotide sequences of the VGAM1733 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1733 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1733 are further described hereinbelow with reference to Table 1.

[24229] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1733 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24230] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1734 (VGAM1734) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24231] VGAM1734 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1734 was detected is described hereinabove with reference to Figs. 2-8.

[24232] VGAM1734 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM1734 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24233] VGAM1734 gene, herein designated VGAM GENE, encodes a VGAM1734 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1734 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1734 precursor RNA is designated SEQ ID:1720, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1720 is located at position 35482 relative to the genome of Human herpesvirus 3.

[24234] VGAM1734 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24235] An enzyme complex designated DICER COMPLEX, dices the VGAM1734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1734 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1734 RNA is designated SEQ ID:4445, and is provided hereinbelow with reference to the sequence listing part.

[24236] VGAM1734 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1734 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1734 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24237] VGAM1734 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1734 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1734 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1734 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1734 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24238] The complementary binding of VGAM1734 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1734 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1734 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1734 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24239] It is appreciated that VGAM1734 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1734 host target genes. The mRNA of each one of this plurality of VGAM1734 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1734 RNA, herein designated VGAM RNA, and which when bound by VGAM1734 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1734 host target proteins.

[24240] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1734 gene, herein designated VGAM GENE, on one or more VGAM1734 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24241] It is yet further appreciated that a function of VGAM1734 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1734 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1734 correlate with, and may be deduced from, the identity of the host target genes which VGAM1734 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24242] Nucleotide sequences of the VGAM1734 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1734 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1734 are further described hereinbelow with reference to Table 1.

[24243] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1734 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24244] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1735 (VGAM1735) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24245] VGAM1735 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1735 was detected is described hereinabove with reference to Figs. 2-8.

[24246] VGAM1735 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM1735 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24247] VGAM1735 gene, herein designated VGAM GENE, encodes a VGAM1735 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1735 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1735 precursor RNA is designated SEQ ID:1721, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1721 is located at position 33659 relative to the genome of Human herpesvirus 3.

[24248] VGAM1735 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24249] An enzyme complex designated DICER COMPLEX, dices the VGAM1735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1735 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1735 RNA is designated SEQ ID:4446, and is provided hereinbelow with reference to the sequence listing part.

[24250] VGAM1735 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1735 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1735 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24251] VGAM1735 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1735 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1735 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1735 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1735 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24252] The complementary binding of VGAM1735 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1735 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1735 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1735 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24253] It is appreciated that VGAM1735 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1735 host target genes. The mRNA of each one of this plurality of VGAM1735 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1735 RNA, herein designated VGAM RNA, and which when bound by VGAM1735 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1735 host target proteins.

[24254] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1735 gene, herein designated VGAM GENE, on one or more VGAM1735 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24255] It is yet further appreciated that a function of VGAM1735 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1735 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1735 correlate with, and may be deduced from, the identity of the host target genes which VGAM1735 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24256] Nucleotide sequences of the VGAM1735 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1735 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1735 are further described hereinbelow with reference to Table 1.

[24257] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1735 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24258] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1736 (VGAM1736) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24259] VGAM1736 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1736 was detected is described hereinabove with reference to Figs. 2-8.

[24260] VGAM1736 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM1736 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24261] VGAM1736 gene, herein designated VGAM GENE, encodes a VGAM1736 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1736 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1736 precursor RNA is designated SEQ ID:1722, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1722 is located at position 39181 relative to the genome of Human herpesvirus 3.

[24262] VGAM1736 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24263] An enzyme complex designated DICER COMPLEX, dices the VGAM1736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1736 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1736 RNA is designated SEQ ID:4447, and is provided hereinbelow with reference to the sequence listing part.

[24264] VGAM1736 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1736 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1736 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24265] VGAM1736 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1736 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1736 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1736 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1736 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24266] The complementary binding of VGAM1736 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1736 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1736 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1736 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[24267] It is appreciated that VGAM1736 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1736 host target genes. The mRNA of each one of this plurality of VGAM1736 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1736 RNA, herein designated VGAM RNA, and which when bound by VGAM1736 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1736 host target proteins.

[24268] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1736 gene, herein designated VGAM GENE, on one or more VGAM1736 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24269] It is yet further appreciated that a function of VGAM1736 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1736 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1736 correlate with, and may be deduced from, the identity of the host target genes which VGAM1736 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24270] Nucleotide sequences of the VGAM1736 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1736 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1736 are further described hereinbelow with reference to Table 1.

[24271] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1736 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24272] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1737 (VGAM1737) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24273] VGAM1737 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1737 was detected is described hereinabove with reference to Figs. 2-8.

[24274] VGAM1737 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM1737 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24275] VGAM1737 gene, herein designated VGAM GENE, encodes a VGAM1737 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1737 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1737 precursor RNA is designated SEQ ID:1723, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1723 is located at position 32691 relative to the genome of Human herpesvirus 3.

[24276] VGAM1737 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24277] An enzyme complex designated DICER COMPLEX, dices the VGAM1737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1737 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1737 RNA is designated SEQ ID:4448, and is provided hereinbelow with reference to the sequence listing part.

[24278] VGAM1737 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1737 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1737 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24279] VGAM1737 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1737 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1737 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1737 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1737 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24280] The complementary binding of VGAM1737 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1737 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1737 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1737 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24281] It is appreciated that VGAM1737 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1737 host target genes. The mRNA of each one of this plurality of VGAM1737 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1737 RNA, herein designated VGAM RNA, and which when bound by VGAM1737 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1737 host target proteins.

[24282] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1737 gene, herein designated VGAM GENE, on one or more VGAM1737 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24283] It is yet further appreciated that a function of VGAM1737 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1737 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1737 correlate with, and may be deduced from, the identity of the host target genes which VGAM1737 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24284] Nucleotide sequences of the VGAM1737 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1737 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1737 are further described hereinbelow with reference to Table 1.

[24285] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1737 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24286] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1738 (VGAM1738) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24287] VGAM1738 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1738 was detected is described hereinabove with reference to Figs. 2-8.

[24288] VGAM1738 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM1738 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24289] VGAM1738 gene, herein designated VGAM GENE, encodes

a VGAM1738 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1738 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1738 precursor RNA is designated SEQ ID:1724, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1724 is located at position 41710 relative to the genome of Human herpesvirus 3.

[24290] VGAM1738 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24291] An enzyme complex designated DICER COMPLEX, dices the VGAM1738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1738 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1738 RNA is designated SEQ ID:4449, and is provided hereinbelow with reference to the sequence listing part.

[24292] VGAM1738 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1738 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1738 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24293] VGAM1738 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1738 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1738 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1738 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1738 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24294] The complementary binding of VGAM1738 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1738 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1738 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1738 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24295] It is appreciated that VGAM1738 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1738 host target genes. The mRNA of each one of this plurality of VGAM1738 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1738 RNA, herein designated VGAM RNA, and which when bound by VGAM1738 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1738 host target proteins.

[24296] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1738 gene, herein designated VGAM GENE, on one or more VGAM1738 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24297] It is yet further appreciated that a function of VGAM1738 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1738 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1738 correlate with, and may be deduced from, the identity of the host target genes which VGAM1738 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24298] Nucleotide sequences of the VGAM1738 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1738 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1738 are further

described hereinbelow with reference to Table 1.

[24299] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1738 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24300] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1739 (VGAM1739) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24301] VGAM1739 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1739 was detected is described hereinabove with reference to Figs. 2-8.

[24302] VGAM1739 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM1739 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24303] VGAM1739 gene, herein designated VGAM GENE, encodes a VGAM1739 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1739 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1739 precursor RNA is designated SEQ ID:1725, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1725 is located at position 38932 relative to the genome of Human herpesvirus 3.

[24304] VGAM1739 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24305] An enzyme complex designated DICER COMPLEX, dices the VGAM1739 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1739 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM1739 RNA is designated SEQ ID:4450, and is provided hereinbelow with reference to the sequence listing part.

[24306] VGAM1739 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1739 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1739 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24307] VGAM1739 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1739 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1739 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1739 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1739 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24308] The complementary binding of VGAM1739 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1739 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1739

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1739 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24309] It is appreciated that VGAM1739 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1739 host target genes. The mRNA of each one of this plurality of VGAM1739 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1739 RNA, herein designated VGAM RNA, and which when bound by VGAM1739 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1739 host target proteins.

[24310] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1739 gene, herein designated VGAM GENE, on one or more VGAM1739 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24311] It is yet further appreciated that a function of VGAM1739 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1739 correlate with, and may be deduced from, the identity of the host target genes which VGAM1739 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24312] Nucleotide sequences of the VGAM1739 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1739 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1739 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1739 are further described hereinbelow with reference to Table 1.

[24313] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1739 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24314] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1740 (VGAM1740) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24315] VGAM1740 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1740 was detected is described hereinabove with reference to Figs. 2-8.

[24316] VGAM1740 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM1740 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[24317] VGAM1740 gene, herein designated VGAM GENE, encodes a VGAM1740 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1740 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1740 precursor RNA is designated SEQ ID:1726, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1726 is located at position 36839 relative to the genome of Human herpesvirus 3.

[24318] VGAM1740 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24319] An enzyme complex designated DICER COMPLEX, dices

the VGAM1740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1740 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1740 RNA is designated SEQ ID:4451, and is provided hereinbelow with reference to the sequence listing part.

[24320] VGAM1740 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1740 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1740 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24321] VGAM1740 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1740 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1740 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1740 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1740 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24322] The complementary binding of VGAM1740 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1740 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1740 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1740 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24323] It is appreciated that VGAM1740 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1740 host target genes. The mRNA of each one of this plurality of VGAM1740 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1740 RNA, herein designated VGAM RNA, and which when bound by VGAM1740 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1740 host target proteins.

[24324] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1740 gene, herein designated VGAM GENE, on one or more VGAM1740 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24325] It is yet further appreciated that a function of VGAM1740 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1740 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1740 correlate with, and may be deduced from, the identity of the host target genes which VGAM1740 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24326] Nucleotide sequences of the VGAM1740 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1740 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1740 are further described hereinbelow with reference to Table 1.

[24327] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1740 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24328] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1741 (VGAM1741) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24329] VGAM1741 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1741 was detected is described hereinabove with reference to Figs. 2-8.

[24330] VGAM1741 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1741 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24331] VGAM1741 gene, herein designated VGAM GENE, encodes a VGAM1741 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1741 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1741 precursor RNA is designated SEQ ID:1727, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1727 is located at position 36070 relative to the genome of Cercopithecine herpesvirus 7.

[24332] VGAM1741 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[24333] An enzyme complex designated DICER COMPLEX, dices the VGAM1741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1741 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1741 RNA is designated SEQ ID:4452, and is provided hereinbelow with reference to the sequence listing part.

[24334] VGAM1741 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1741 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1741 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24335] VGAM1741 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1741 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1741 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1741 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24336] The complementary binding of VGAM1741 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1741 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1741 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1741 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24337] It is appreciated that VGAM1741 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1741 host target genes. The mRNA of each one of this plurality of VGAM1741 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1741 RNA, herein designated VGAM RNA, and which when bound by VGAM1741 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1741 host target proteins.

[24338] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1741 gene, herein designated VGAM GENE, on one or more VGAM1741 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24339] It is yet further appreciated that a function of VGAM1741 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1741 correlate with, and may be deduced from, the identity of the host target genes which VGAM1741 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24340] Nucleotide sequences of the VGAM1741 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1741 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1741 are further described hereinbelow with reference to Table 1.

[24341] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1741 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24342] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1742 (VGAM1742) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24343] VGAM1742 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1742 was detected is described hereinabove with reference to Figs. 2-8.

[24344] VGAM1742 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1742 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24345] VGAM1742 gene, herein designated VGAM GENE, encodes a VGAM1742 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1742 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1742 precursor RNA is designated SEQ ID:1728, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1728 is located at position 40735 relative to the genome of Cercopithecine herpesvirus 7.

[24346] VGAM1742 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24347] An enzyme complex designated DICER COMPLEX, dices the VGAM1742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1742 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1742 RNA is designated SEQ ID:4453, and is provided hereinbelow with reference to the sequence listing part.

[24348] VGAM1742 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1742 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1742 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[24349] VGAM1742 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1742 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1742 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1742 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1742 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24350] The complementary binding of VGAM1742 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1742 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1742 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1742 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24351] It is appreciated that VGAM1742 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1742 host target genes. The mRNA of each one of this plurality of VGAM1742 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1742 RNA, herein designated VGAM RNA, and which when bound by VGAM1742 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1742 host target proteins.

[24352] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1742 gene, herein designated VGAM GENE, on one

or more VGAM1742 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24353] It is yet further appreciated that a function of VGAM1742 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1742 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1742 correlate with, and may be deduced from, the identity of the host target genes which VGAM1742 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24354] Nucleotide sequences of the VGAM1742 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1742 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1742 are further described hereinbelow with reference to Table 1.

[24355] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1742 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24356] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1743 (VGAM1743) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24357] VGAM1743 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1743 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[24358] VGAM1743 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1743 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24359] VGAM1743 gene, herein designated VGAM GENE, encodes a VGAM1743 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1743 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1743 precursor RNA is designated SEQ ID:1729, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1729 is located at position 41519 relative to the genome of Cercopithecine herpesvirus 7.

[24360] VGAM1743 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24361] An enzyme complex designated DICER COMPLEX, dices the VGAM1743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1743 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1743 RNA is designated SEQ ID:4454, and is provided hereinbelow with reference to the sequence listing part.

[24362] VGAM1743 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1743 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1743 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24363] VGAM1743 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1743 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1743 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1743 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1743 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24364] The complementary binding of VGAM1743 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1743 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1743 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1743 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24365] It is appreciated that VGAM1743 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1743 host target genes. The mRNA of each one of this plurality of VGAM1743 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1743 RNA, herein designated VGAM RNA, and which when bound by VGAM1743 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1743 host target proteins.

[24366] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1743 gene, herein designated VGAM GENE, on one or more VGAM1743 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24367] It is yet further appreciated that a function of VGAM1743 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1743 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1743 correlate with, and may be deduced from, the identity of the host target genes which VGAM1743 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24368] Nucleotide sequences of the VGAM1743 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1743 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1743 are further described hereinbelow with reference to Table 1.

[24369] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1743 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24370] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1744 (VGAM1744) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24371] VGAM1744 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1744 was detected is described hereinabove with reference to Figs. 2-8.

[24372] VGAM1744 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1744 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24373] VGAM1744 gene, herein designated VGAM GENE, encodes a VGAM1744 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1744 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1744 precursor RNA is designated SEQ ID:1730, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1730 is located at position 38434 relative to the genome of Cercopithecine herpesvirus 7.

[24374] VGAM1744 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1744 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24375] An enzyme complex designated DICER COMPLEX, dices the VGAM1744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1744 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1744 RNA is designated SEQ ID:4455, and is provided hereinbelow with reference to the sequence listing part.

[24376] VGAM1744 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1744 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1744 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24377] VGAM1744 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1744 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1744 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1744 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1744 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24378] The complementary binding of VGAM1744 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1744 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1744 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1744 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24379] It is appreciated that VGAM1744 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1744 host target genes. The mRNA of each one of this plurality of VGAM1744 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1744 RNA, herein designated VGAM RNA, and which when bound by VGAM1744 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1744 host target proteins.

[24380] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1744 gene, herein designated VGAM GENE, on one or more VGAM1744 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24381] It is yet further appreciated that a function of VGAM1744 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1744 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of

VGAM1744 correlate with, and may be deduced from, the identity of the host target genes which VGAM1744 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24382] Nucleotide sequences of the VGAM1744 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1744 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1744 are further described hereinbelow with reference to Table 1.

[24383] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1744 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24384] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1745 (VGAM1745) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[24385] VGAM1745 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1745 was detected is described hereinabove with reference to Figs. 2-8.

[24386] VGAM1745 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1745 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24387] VGAM1745 gene, herein designated VGAM GENE, encodes a VGAM1745 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1745 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1745 precursor RNA is designated SEQ ID:1731, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1731 is located at position 37836 relative to the genome of Cercopithecine herpesvirus 7.

[24388] VGAM1745 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24389] An enzyme complex designated DICER COMPLEX, dices the VGAM1745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1745 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1745 RNA is designated SEQ ID:4456, and is provided hereinbelow with reference to the sequence listing part.

[24390] VGAM1745 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1745 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1745 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24391] VGAM1745 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1745 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1745 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1745 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1745 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24392] The complementary binding of VGAM1745 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1745 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1745 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1745 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24393] It is appreciated that VGAM1745 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1745 host target genes. The mRNA of each one of this plurality of VGAM1745 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1745 RNA, herein designated VGAM RNA, and which when bound by VGAM1745 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1745 host target proteins.

[24394] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1745 gene, herein designated VGAM GENE, on one or more VGAM1745 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24395] It is yet further appreciated that a function of VGAM1745 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1745 include diagnosis, prevention and

treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1745 correlate with, and may be deduced from, the identity of the host target genes which VGAM1745 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24396] Nucleotide sequences of the VGAM1745 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1745 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1745 are further described hereinbelow with reference to Table 1.

[24397] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1745 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24398] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1746 (VGAM1746) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24399] VGAM1746 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1746 was detected is described hereinabove with reference to Figs. 2-8.

[24400] VGAM1746 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1746 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24401] VGAM1746 gene, herein designated VGAM GENE, encodes a VGAM1746 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1746 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1746 precursor RNA is designated SEQ ID:1732, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1732 is located at position 40845 relative to the genome of Cercopithecine her-

pesvirus 7.

[24402] VGAM1746 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24403] An enzyme complex designated DICER COMPLEX, dices the VGAM1746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1746 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1746 RNA is designated SEQ ID:4457, and is provided hereinbelow with reference to the sequence listing part.

[24404] VGAM1746 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1746 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1746 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24405] VGAM1746 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1746 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1746 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1746 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1746 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24406] The complementary binding of VGAM1746 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1746 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1746 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1746 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24407] It is appreciated that VGAM1746 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1746 host target genes. The mRNA of each one of this plurality of VGAM1746 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1746 RNA, herein designated VGAM RNA, and which when bound by VGAM1746 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1746 host target proteins.

[24408] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1746 gene, herein designated VGAM GENE, on one or more VGAM1746 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24409] It is yet further appreciated that a function of VGAM1746 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1746 correlate with, and may be deduced from, the identity of the host target genes which VGAM1746 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24410] Nucleotide sequences of the VGAM1746 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1746 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1746 are further described hereinbelow with reference to Table 1.

[24411] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1746 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24412] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1747 (VGAM1747) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24413] VGAM1747 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1747 was detected is described hereinabove with reference to Figs. 2-8.

[24414] VGAM1747 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1747 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24415] VGAM1747 gene, herein designated VGAM GENE, encodes a VGAM1747 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1747 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1747 precursor RNA is designated SEQ ID:1733, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1733 is located at position 11942 relative to the genome of Camelpox virus.

[24416] VGAM1747 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24417] An enzyme complex designated DICER COMPLEX, dices the VGAM1747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1747 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1747 RNA is designated SEQ ID:4458, and is provided hereinbelow with reference to the sequence

listing part.

[24418] VGAM1747 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1747 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1747 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24419] VGAM1747 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1747 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1747 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1747 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1747 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24420] The complementary binding of VGAM1747 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1747 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1747 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1747 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24421] It is appreciated that VGAM1747 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1747 host target genes. The mRNA of each one of this plurality of VGAM1747 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1747 RNA, herein designated VGAM RNA, and which when bound by VGAM1747 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1747 host target proteins.

[24422] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1747 gene, herein designated VGAM GENE, on one or more VGAM1747 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24423] It is yet further appreciated that a function of VGAM1747

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1747 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1747 correlate with, and may be deduced from, the identity of the host target genes which VGAM1747 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24424] Nucleotide sequences of the VGAM1747 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1747 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1747 are further described hereinbelow with reference to Table 1.

[24425] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1747 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24426] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1748 (VGAM1748) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24427] VGAM1748 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1748 was detected is described hereinabove with reference to Figs. 2-8.

[24428] VGAM1748 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1748 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24429] VGAM1748 gene, herein designated VGAM GENE, encodes a VGAM1748 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1748 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1748 precursor RNA is designated SEQ ID:1734, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1734 is located at position 67 relative to the genome of Camelpox virus.

[24430] VGAM1748 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24431] An enzyme complex designated DICER COMPLEX, dices the VGAM1748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1748 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1748 RNA is designated SEQ ID:4459, and

is provided hereinbelow with reference to the sequence listing part.

[24432] VGAM1748 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1748 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1748 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24433] VGAM1748 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1748 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1748 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1748 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1748 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24434] The complementary binding of VGAM1748 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1748 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1748 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1748 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24435] It is appreciated that VGAM1748 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1748 host target genes. The mRNA of each one of this plurality of VGAM1748 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1748 RNA, herein designated VGAM RNA, and which when bound by VGAM1748 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1748 host target proteins.

[24436] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1748 gene, herein designated VGAM GENE, on one or more VGAM1748 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24437] It is yet further appreciated that a function of VGAM1748 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1748 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1748 correlate with, and may be deduced from, the identity of the host target genes which VGAM1748 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24438] Nucleotide sequences of the VGAM1748 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1748 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1748 are further described hereinbelow with reference to Table 1.

[24439] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1748 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24440] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1749 (VGAM1749) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24441] VGAM1749 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1749 was detected is described hereinabove with reference to Figs. 2-8.

[24442] VGAM1749 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1749 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24443] VGAM1749 gene, herein designated VGAM GENE, encodes a VGAM1749 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1749 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1749 precur-

sor RNA is designated SEQ ID:1735, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1735 is located at position 4361 relative to the genome of Camelpox virus.

[24444] VGAM1749 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24445] An enzyme complex designated DICER COMPLEX, dices the VGAM1749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1749 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM1749 RNA is designated SEQ ID:4460, and is provided hereinbelow with reference to the sequence listing part.

[24446] VGAM1749 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1749 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1749 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24447] VGAM1749 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1749 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1749 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1749 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24448] The complementary binding of VGAM1749 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1749 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1749 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1749 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24449] It is appreciated that VGAM1749 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1749 host target genes. The mRNA of

each one of this plurality of VGAM1749 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1749 RNA, herein designated VGAM RNA, and which when bound by VGAM1749 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1749 host target proteins.

[24450] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1749 gene, herein designated VGAM GENE, on one or more VGAM1749 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24451] It is yet further appreciated that a function of VGAM1749 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1749 correlate with, and may be deduced from, the identity of the host target genes which VGAM1749 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24452] Nucleotide sequences of the VGAM1749 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1749 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1749 are further described hereinbelow with reference to Table 1.

[24453] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1749 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24454] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1750 (VGAM1750) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24455] VGAM1750 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1750 was detected is described hereinabove with reference to Figs. 2-8.

[24456] VGAM1750 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1750 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24457] VGAM1750 gene, herein designated VGAM GENE, encodes a VGAM1750 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1750 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1750 precursor RNA is designated SEQ ID:1736, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1736 is located at position 1194 relative to the genome of Camelpox virus.

[24458] VGAM1750 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24459] An enzyme complex designated DICER COMPLEX, dices the VGAM1750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1750 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1750 RNA is designated SEQ ID:4461, and is provided hereinbelow with reference to the sequence listing part.

[24460] VGAM1750 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1750 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1750 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24461] VGAM1750 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1750 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1750 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1750 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1750 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24462] The complementary binding of VGAM1750 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1750 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1750 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1750 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24463] It is appreciated that VGAM1750 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1750 host target genes. The mRNA of each one of this plurality of VGAM1750 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1750 RNA, herein designated VGAM RNA, and which when bound by VGAM1750 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1750 host target proteins.

[24464] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1750 gene, herein designated VGAM GENE, on one or more VGAM1750 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24465] It is yet further appreciated that a function of VGAM1750 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1750 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1750 correlate with, and may be deduced from, the identity of the host target genes which VGAM1750 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24466] Nucleotide sequences of the VGAM1750 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1750 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1750 are further described hereinbelow with reference to Table 1.

[24467] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1750 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24468] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1751 (VGAM1751) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24469] VGAM1751 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1751 was detected is described hereinabove with reference to Figs. 2-8.

[24470] VGAM1751 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1751 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24471] VGAM1751 gene, herein designated VGAM GENE, encodes a VGAM1751 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1751 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1751 precursor RNA is designated SEQ ID:1737, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1737 is located at position 58 relative to the genome of Camelpox virus.

[24472] VGAM1751 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24473] An enzyme complex designated DICER COMPLEX, dices the VGAM1751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1751 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1751 RNA is designated SEQ ID:4462, and is provided hereinbelow with reference to the sequence listing part.

[24474] VGAM1751 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1751 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1751 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24475] VGAM1751 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1751 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1751 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1751 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1751 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24476] The complementary binding of VGAM1751 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1751 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1751 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1751 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24477] It is appreciated that VGAM1751 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1751 host target genes. The mRNA of each one of this plurality of VGAM1751 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1751 RNA, herein designated VGAM RNA, and which when bound by VGAM1751 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1751 host target proteins.

[24478] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1751 gene, herein designated VGAM GENE, on one or more VGAM1751 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24479] It is yet further appreciated that a function of VGAM1751 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1751 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1751 correlate with, and may be deduced from, the identity of the host target genes which VGAM1751 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24480] Nucleotide sequences of the VGAM1751 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1751 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1751 are further described hereinbelow with reference to Table 1.

[24481] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1751 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24482] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1752 (VGAM1752) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24483] VGAM1752 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1752 was detected is described hereinabove with reference to Figs. 2-8.

[24484] VGAM1752 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1752 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24485] VGAM1752 gene, herein designated VGAM GENE, encodes a VGAM1752 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1752 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1752 precursor RNA is designated SEQ ID:1738, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1738 is located at position 2927 relative to the genome of Camelpox virus.

[24486] VGAM1752 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24487] An enzyme complex designated DICER COMPLEX, dices the VGAM1752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1752 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1752 RNA is designated SEQ ID:4463, and is provided hereinbelow with reference to the sequence listing part.

[24488] VGAM1752 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1752 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1752 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[24489] VGAM1752 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1752 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1752 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1752 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1752 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24490] The complementary binding of VGAM1752 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1752 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1752 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1752 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24491] It is appreciated that VGAM1752 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1752 host target genes. The mRNA of each one of this plurality of VGAM1752 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1752 RNA, herein designated VGAM RNA, and which when bound by VGAM1752 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1752 host target proteins.

[24492] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1752 gene, herein designated VGAM GENE, on one

or more VGAM1752 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24493] It is yet further appreciated that a function of VGAM1752 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1752 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1752 correlate with, and may be deduced from, the identity of the host target genes which VGAM1752 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24494] Nucleotide sequences of the VGAM1752 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1752 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1752 are further described hereinbelow with reference to Table 1.

[24495] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1752 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24496] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1753 (VGAM1753) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24497] VGAM1753 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1753 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[24498] VGAM1753 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1753 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24499] VGAM1753 gene, herein designated VGAM GENE, encodes a VGAM1753 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1753 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1753 precursor RNA is designated SEQ ID:1739, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1739 is located at position 2271 relative to the genome of Camelpox virus.

[24500] VGAM1753 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24501] An enzyme complex designated DICER COMPLEX, dices the VGAM1753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1753 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1753 RNA is designated SEQ ID:4464, and is provided hereinbelow with reference to the sequence listing part.

[24502] VGAM1753 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1753 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1753 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24503] VGAM1753 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1753 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1753 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1753 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1753 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[24504] The complementary binding of VGAM1753 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1753 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1753 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1753 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24505] It is appreciated that VGAM1753 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1753 host target genes. The mRNA of each one of this plurality of VGAM1753 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1753 RNA, herein designated VGAM RNA, and which when bound by VGAM1753 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1753 host target proteins.

[24506] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1753 gene, herein designated VGAM GENE, on one or more VGAM1753 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24507] It is yet further appreciated that a function of VGAM1753 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1753 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1753 correlate with, and may be deduced from, the identity of the host target genes which VGAM1753 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[24508] Nucleotide sequences of the VGAM1753 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1753 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1753 are further described hereinbelow with reference to Table 1.

[24509] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1753 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24510] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1754 (VGAM1754) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24511] VGAM1754 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1754 was detected is described hereinabove with reference to Figs. 2-8.

[24512] VGAM1754 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1754 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24513] VGAM1754 gene, herein designated VGAM GENE, encodes a VGAM1754 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1754 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1754 precursor RNA is designated SEQ ID:1740, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1740 is located at position 9493 relative to the genome of Camelpox virus.

[24514] VGAM1754 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24515] An enzyme complex designated DICER COMPLEX, dices the VGAM1754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1754 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1754 RNA is designated SEQ ID:4465, and is provided hereinbelow with reference to the sequence listing part.

[24516] VGAM1754 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1754 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1754 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24517] VGAM1754 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1754 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1754 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1754 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24518] The complementary binding of VGAM1754 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1754 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1754 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1754 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24519] It is appreciated that VGAM1754 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1754 host target genes. The mRNA of each one of this plurality of VGAM1754 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1754 RNA, herein designated VGAM RNA, and which when bound by VGAM1754 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1754 host target proteins.

[24520] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1754 gene, herein designated VGAM GENE, on one or more VGAM1754 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24521] It is yet further appreciated that a function of VGAM1754 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1754 correlate with, and may be deduced from, the identity of the host target genes which VGAM1754 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[24522] Nucleotide sequences of the VGAM1754 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1754 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1754 are further described hereinbelow with reference to Table 1.

[24523] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1754 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24524] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1755 (VGAM1755) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24525] VGAM1755 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1755 was detected is described hereinabove with reference to Figs. 2-8.

[24526] VGAM1755 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1755 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24527] VGAM1755 gene, herein designated VGAM GENE, encodes a VGAM1755 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1755 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1755 precursor RNA is designated SEQ ID:1741, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1741 is located at position 5746 relative to the genome of Camelpox virus.

[24528] VGAM1755 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24529] An enzyme complex designated DICER COMPLEX, dices the VGAM1755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1755 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1755 RNA is designated SEQ ID:4466, and is provided hereinbelow with reference to the sequence listing part.

[24530] VGAM1755 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1755 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1755 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24531] VGAM1755 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1755 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1755 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1755 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1755 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24532] The complementary binding of VGAM1755 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1755 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1755 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1755 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24533] It is appreciated that VGAM1755 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1755 host target genes. The mRNA of each one of this plurality of VGAM1755 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1755 RNA, herein designated VGAM RNA, and which when bound by VGAM1755 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1755 host target proteins.

[24534] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1755 gene, herein designated VGAM GENE, on one or more VGAM1755 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24535] It is yet further appreciated that a function of VGAM1755 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1755 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1755 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1755 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24536] Nucleotide sequences of the VGAM1755 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1755 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1755 are further described hereinbelow with reference to Table 1.

[24537] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1755 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24538] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1756 (VGAM1756) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24539] VGAM1756 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1756 was detected is described hereinabove with reference to Figs. 2-8.

[24540] VGAM1756 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1756 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24541] VGAM1756 gene, herein designated VGAM GENE, encodes a VGAM1756 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1756 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1756 precursor RNA is designated SEQ ID:1742, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1742 is located at position 7373 relative to the genome of Camelpox virus.

[24542] VGAM1756 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1756 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24543] An enzyme complex designated DICER COMPLEX, dices the VGAM1756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1756 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1756 RNA is designated SEQ ID:4467, and is provided hereinbelow with reference to the sequence listing part.

[24544] VGAM1756 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1756 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1756 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24545] VGAM1756 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1756 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1756 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1756 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1756 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24546] The complementary binding of VGAM1756 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1756 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1756 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1756 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24547] It is appreciated that VGAM1756 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1756 host target genes. The mRNA of each one of this plurality of VGAM1756 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1756 RNA, herein designated VGAM RNA, and which when bound by VGAM1756 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1756 host target proteins.

[24548] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1756 gene, herein designated VGAM GENE, on one or more VGAM1756 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24549] It is yet further appreciated that a function of VGAM1756 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1756 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1756 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1756 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24550] Nucleotide sequences of the VGAM1756 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1756 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1756 are further described hereinbelow with reference to Table 1.

[24551] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1756 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24552] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1757 (VGAM1757) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[24553] VGAM1757 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1757 was detected is described hereinabove with reference to Figs. 2-8.

[24554] VGAM1757 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1757 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24555] VGAM1757 gene, herein designated VGAM GENE, encodes a VGAM1757 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1757 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1757 precursor RNA is designated SEQ ID:1743, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1743 is located at position 5203 relative to the genome of Camelpox virus.

[24556] VGAM1757 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1757 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24557] An enzyme complex designated DICER COMPLEX, dices the VGAM1757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1757 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1757 RNA is designated SEQ ID:4468, and is provided hereinbelow with reference to the sequence listing part.

[24558] VGAM1757 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1757 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1757 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24559] VGAM1757 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1757 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1757 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1757 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1757 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24560] The complementary binding of VGAM1757 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1757 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1757 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1757 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24561] It is appreciated that VGAM1757 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1757 host target genes. The mRNA of each one of this plurality of VGAM1757 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1757 RNA, herein designated VGAM RNA, and which when bound by VGAM1757 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1757 host target proteins.

[24562] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1757 gene, herein designated VGAM GENE, on one or more VGAM1757 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24563] It is yet further appreciated that a function of VGAM1757 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1757 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific

functions, and accordingly utilities, of VGAM1757 correlate with, and may be deduced from, the identity of the host target genes which VGAM1757 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24564] Nucleotide sequences of the VGAM1757 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1757 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1757 are further described hereinbelow with reference to Table 1.

[24565] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1757 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24566] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1758 (VGAM1758) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[24567] VGAM1758 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1758 was detected is described hereinabove with reference to Figs. 2-8.

[24568] VGAM1758 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1758 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24569] VGAM1758 gene, herein designated VGAM GENE, encodes a VGAM1758 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1758 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1758 precursor RNA is designated SEQ ID:1744, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1744 is located at position 60 relative to the genome of Camelpox virus.

[24570] VGAM1758 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24571] An enzyme complex designated DICER COMPLEX, dices the VGAM1758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1758 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1758 RNA is designated SEQ ID:4469, and is provided hereinbelow with reference to the sequence listing part.

[24572] VGAM1758 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1758 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1758 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24573] VGAM1758 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1758 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1758 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1758 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1758 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24574] The complementary binding of VGAM1758 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1758 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1758 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1758 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24575] It is appreciated that VGAM1758 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1758 host target genes. The mRNA of each one of this plurality of VGAM1758 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1758 RNA, herein designated VGAM RNA, and which when bound by VGAM1758 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1758 host target proteins.

[24576] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1758 gene, herein designated VGAM GENE, on one or more VGAM1758 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24577] It is yet further appreciated that a function of VGAM1758 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1758 include diagnosis, prevention and

treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1758 correlate with, and may be deduced from, the identity of the host target genes which VGAM1758 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24578] Nucleotide sequences of the VGAM1758 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1758 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1758 are further described hereinbelow with reference to Table 1.

[24579] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1758 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24580] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1759 (VGAM1759) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24581] VGAM1759 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1759 was detected is described hereinabove with reference to Figs. 2-8.

[24582] VGAM1759 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2). VGAM1759 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24583] VGAM1759 gene, herein designated VGAM GENE, encodes a VGAM1759 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1759 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1759 precursor RNA is designated SEQ ID:1745, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1745 is located at position 12109 relative to the genome of Bovine viral diarrhea

virus genotype 2 (BVDV-2).

[24584] VGAM1759 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24585] An enzyme complex designated DICER COMPLEX, dices the VGAM1759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1759 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM1759 RNA is designated SEQ ID:4470, and is provided hereinbelow with reference to the sequence listing part.

[24586] VGAM1759 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1759 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1759 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24587] VGAM1759 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1759 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1759 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1759 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1759 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24588] The complementary binding of VGAM1759 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1759 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1759 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1759 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24589] It is appreciated that VGAM1759 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1759 host target genes. The mRNA of each one of this plurality of VGAM1759 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1759 RNA, herein designated VGAM RNA, and which when bound by VGAM1759 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1759 host target proteins.

[24590] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1759 gene, herein designated VGAM GENE, on one or more VGAM1759 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24591] It is yet further appreciated that a function of VGAM1759 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1759 include diagnosis, prevention and treatment of viral infection by Bovine viral diarrhea virus genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1759 correlate with, and may be deduced from, the identity of the host target genes which VGAM1759 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24592] Nucleotide sequences of the VGAM1759 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1759 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1759 are further described hereinbelow with reference to Table 1.

[24593] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1759 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24594] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1760 (VGAM1760) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24595] VGAM1760 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1760 was detected is described hereinabove with reference to Figs. 2-8.

[24596] VGAM1760 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2). VGAM1760 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24597] VGAM1760 gene, herein designated VGAM GENE, encodes a VGAM1760 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1760 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1760 precursor RNA is designated SEQ ID:1746, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1746 is located at position 7567 relative to the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2).

[24598] VGAM1760 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24599] An enzyme complex designated DICER COMPLEX, dices the VGAM1760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1760 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1760 RNA is designated SEQ ID:4471, and

is provided hereinbelow with reference to the sequence listing part.

[24600] VGAM1760 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1760 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1760 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24601] VGAM1760 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1760 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1760 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1760 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1760 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24602] The complementary binding of VGAM1760 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1760 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1760 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1760 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24603] It is appreciated that VGAM1760 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1760 host target genes. The mRNA of each one of this plurality of VGAM1760 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1760 RNA, herein designated VGAM RNA, and which when bound by VGAM1760 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1760 host target proteins.

[24604] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1760 gene, herein designated VGAM GENE, on one or more VGAM1760 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24605] It is yet further appreciated that a function of VGAM1760 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1760 include diagnosis, prevention and treatment of viral infection by Bovine viral diarrhea virus genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1760 correlate with, and may be deduced from, the identity of the host target genes which VGAM1760 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24606] Nucleotide sequences of the VGAM1760 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1760 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1760 are further described hereinbelow with reference to Table 1.

[24607] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1760 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24608] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1761 (VGAM1761) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24609] VGAM1761 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1761 was detected is described hereinabove with reference to Figs. 2-8.

[24610] VGAM1761 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2). VGAM1761 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24611] VGAM1761 gene, herein designated VGAM GENE, encodes a VGAM1761 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1761 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1761 precur-

sor RNA is designated SEQ ID:1747, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1747 is located at position 11998 relative to the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2).

[24612] VGAM1761 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24613] An enzyme complex designated DICER COMPLEX, dices the VGAM1761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1761 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1761 RNA is designated SEQ ID:4472, and is provided hereinbelow with reference to the sequence listing part.

[24614] VGAM1761 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1761 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1761 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24615] VGAM1761 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1761 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1761 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1761 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24616] The complementary binding of VGAM1761 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1761 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1761 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1761 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24617] It is appreciated that VGAM1761 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1761 host target genes. The mRNA of each one of this plurality of VGAM1761 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1761 RNA, herein designated VGAM RNA, and which when bound by VGAM1761 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1761 host target proteins.

[24618] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1761 gene, herein designated VGAM GENE, on one or more VGAM1761 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24619] It is yet further appreciated that a function of VGAM1761 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of viral infection by Bovine viral diarrhea virus genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1761 correlate with, and may be deduced from, the identity of the host target genes which VGAM1761 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24620] Nucleotide sequences of the VGAM1761 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1761 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1761 are further described hereinbelow with reference to Table 1.

[24621] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1761 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24622] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1762 (VGAM1762) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24623] VGAM1762 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1762 was detected is described hereinabove with reference to Figs. 2-8.

[24624] VGAM1762 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2). VGAM1762 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24625] VGAM1762 gene, herein designated VGAM GENE, encodes a VGAM1762 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1762 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1762 precursor RNA is designated SEQ ID:1748, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1748 is located at position 2442 relative to the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2).

[24626] VGAM1762 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24627] An enzyme complex designated DICER COMPLEX, dices the VGAM1762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1762 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1762 RNA is designated SEQ ID:4473, and is provided hereinbelow with reference to the sequence listing part.

[24628] VGAM1762 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1762 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1762 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24629] VGAM1762 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1762 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1762 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1762 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1762 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24630] The complementary binding of VGAM1762 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1762 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1762 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1762 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24631] It is appreciated that VGAM1762 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1762 host target genes. The mRNA of each one of this plurality of VGAM1762 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1762 RNA, herein designated VGAM RNA, and which when bound by VGAM1762 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1762 host target proteins.

[24632] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1762 gene, herein designated VGAM GENE, on one or more VGAM1762 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24633] It is yet further appreciated that a function of VGAM1762 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1762 include diagnosis, prevention and treatment of viral infection by Bovine viral diarrhea virus genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1762 correlate with, and may be deduced from, the identity of the host target genes which VGAM1762 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24634] Nucleotide sequences of the VGAM1762 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1762 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1762 are further described hereinbelow with reference to Table 1.

[24635] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1762 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24636] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1763 (VGAM1763) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24637] VGAM1763 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1763 was detected is described hereinabove with reference to Figs. 2-8.

[24638] VGAM1763 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2). VGAM1763 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24639] VGAM1763 gene, herein designated VGAM GENE, encodes a VGAM1763 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1763 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1763 precursor RNA is designated SEQ ID:1749, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1749 is located at position 11479 relative to the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2).

[24640] VGAM1763 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24641] An enzyme complex designated DICER COMPLEX, dices the VGAM1763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1763 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1763 RNA is designated SEQ ID:4474, and is provided hereinbelow with reference to the sequence listing part.

[24642] VGAM1763 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1763 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1763 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24643] VGAM1763 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1763 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1763 RNA, herein designated
